**07/20**

PART 1 GENERAL

Attachments:

Appendix A - Contract Document Distribution List
Utility Outage Guidance: FC Reg 420-19 and Request Form: FC FORM 420-E
Project Sign Details

1.1 EQUIPMENT OWNERSHIP AND OPERATING EXPENSE SCHEDULE

In accordance with FAR 31.105(d)(2)(i)(b), for the predetermined schedule of construction equipment use rates, use Engineer Pamphlet (EP) 1110-1-8, Construction Equipment Ownership and Operating Expense Schedule. Copies of each regional schedule may be obtained through the following internet site:

https://www.publications.usace.army.mil/USACE-Publications/Engineer-Pamphlets/ on pages 10 and 11 of 13.

1.2 CONTRACTOR SUPPLY AND USE OF ELECTRONIC SOFTWARE FOR PROCESSING CONSTRUCTION WAGE RATE REQUIREMENTS STATUTE CERTIFIED LABOR PAYROLLS

a. The Contractor is encouraged to use a commercially-available electronic system to process and submit certified payrolls electronically to the Government. The requirements for preparing, processing and providing certified labor payrolls are established by the Wage Rate Requirements statute.

b.The Contractor is responsible for obtaining and providing for all access, licenses, and other services required to provide for receipt, processing, certifying, electronically transmitting to the Government, and storing weekly payrolls and other data required for the Contractor to comply with the Wage Rate Requirements statute. When the Contractor uses an electronic payroll system, use the electronic payroll service used by the Contractor to prepare, process, and maintain the relevant payrolls and basic records during all work under this construction contract. The electronic payroll service must be capable of preserving these payrolls and related basic records for the required three years after contract completion. The Contractor must obtain and provide electronic system access to the Government, as required to comply with the Wage Rate Requirements over the duration of the construction contract.

(c) The Contractor's provision and use of an electronic payroll processing system must meet the following basic functional criteria:

(1) commercially available;

(2) compliant with appropriate Wage Rate Requirements statute payroll provisions in the FAR;

(3) able to accommodate the required numbers of employees and

subcontractors planned to be employed under the contract;

(4) capable of producing an Excel spreadsheet-compatible electronic output of weekly payroll records for export into an Excel spreadsheet to be imported into the contractor's mode of Resident Management System 3.0;

(5) demonstrated security of data and data entry rights;

(6) ability to produce Contractor-certified electronic versions of weekly payroll data;

(7) ability to identify erroneous entries and track the data/time of all versions of the certified Wage Rate Requirements statute payrolls submitted to the government over the life of the contract;

(8) capable of generating a durable record copy in a Compact Disc (CD) or Digital Versatile Disc (DVD) and Portable Document Format (PDF) file record of data from the system database at the end of the contract closeout. This durable record copy of data from the electronic payroll processing system must be provided to the Government during contract closeout.

d. All Contractor-incurred costs related to the Contractor's provision and use of an electronic payroll processing service must be included in the Contractor's price for the overall work under the contract. The costs for compliance with the Wage Rate Requirements statute by using electronic payroll processing services must not be a separately bid or reimbursed item under this contract.

## 1.3 VETERANS EMPLOYMENT EMPHASIS FOR U.S. ARMY CORPS OF ENGINEERS CONTRACTS

In addition to complying with the requirements outlined in FAR Part 22.13, FAR Provision 52.222-38, FAR Clause 52.222-35, FAR Clause 52.222-37, DFARS 222.13 and Department of Labor regulations, U.S. Army Corps of Engineers (USACE) contractors and subcontractors at all tiers are encouraged to promote the training and employment of U.S. veterans while performing under a USACE contract. While no set-aside, evaluation preference, or incentive applies to the solicitation or performance under the resultant contract, USACE contractors are encouraged to seek out highly qualified veterans to perform services under this contract. The following resources are available to assist USACE contractors in their outreach efforts:

- U.S. Department of Labor Veterans’ Employment and Training Service (VETS):
https://www.dol.gov/vets/
- Federal Veteran Employment Information: https://www.fedshirevets.gov/
- Veterans Opportunity to Work (VOW) Program:
https://www.benefits.va.gov/vow/
- U.S. Army Warrior Transition Command Employment Index:
https://wct.army.mil/modules/employers/index.html
- Hiring Our Heroes: https://www.uschamberfoundation.org/hiring-our-heroes

## 1.4 COMPLETION OF WORK

See Section 00 73 00 SUPPLEMENTARY CONDITIONS (SPECIAL CONTRACT REQUIREMENTS), FAR 52.211-10 COMMENCEMENT, PROSECUTION, AND COMPLETION OF WORK (APR 1984).

## 1.5 CONTRACTOR PERFORMANCE EVALUATIONS

Federal Acquisition Regulation (FAR) Subpart 36.201(Evaluation of Contractor Performance) requires evaluation of the construction contractor's performance throughout the contract period of performance. For construction contracts valued at or above $700,000.00, including all modifications, the USACE will evaluate Contractor's performance using the web-based Contractors Performance Assessment Reporting System (CPARS). After the USACE drafts an evaluation (interim or final), the Contractor will have the opportunity to access, review, comment and either concur or non-concur with the evaluation in the CPARS system for a period of 60 days. Access to the CPARS system requires either specific software called PKI certification (recommended method) or a username and password. The PKI certification is a Department of Defense recommendation and to provide security in electronic transactions. The certification software could cost approximately $110 - $125 per certificate per year and may be purchased from an External Certificate Authorities (ECA) vendor. Current information about the PKI certification process and contacting vendors can be found on the web site: https://www.cpars.gov.

## 1.6 LIQUIDATED DAMAGES-CONSTRUCTION

See Section 00 73 00 SUPPLEMENTARY CONDITIONS (SPECIAL CONTRACT REQUIREMENTS), FAR 52.211-12 LIQUIDATED DAMAGES-CONSTRUCTION (SEPT 2000).

## 1.7 ANTITERRORISM (AT)/OPERATIONS SECURITY (OPSEC) PROVISIONS

1. AT Level I Training

All Contractor employees, to include subcontractor employees, requiring access to Army installations, facilities and controlled access areas shall complete AT Level I awareness training within 30 calendar days after contract start date or effective date of incorporation of this requirement into the contract, whichever is applicable. Upon request, the Contractor shall submit certificates of completion for each affected Contractor employee and subcontractor employee, to the COR or to the contracting officer (if a COR is not assigned), within 5 calendar days after completion of training by all employees and subcontractor personnel. AT Level I awareness training is available at the following website: http://jko.jten.mil/courses/atl1/launch.html; or it can be provided by the RA ATO in presentation form which will be documented via memorandum.

2. Access and General Protection/Security Policy and Procedures

All contractor and all associated sub-contractors employees shall comply with applicable installation, facility and area commander installation/facility access and local security policies and procedures (provided by government representative). The contractor shall also provide all information required for background checks to meet installation/facility access requirements to be accomplished by installation Provost Marshal Office, Director of Emergency Services or Security Office. Contractor workforce must comply with all personal identity verification requirements (FAR clause 52.204-9, Personal Identity Verification of Contractor Personnel) as directed by DOD, HQDA and/or local policy. In addition to the changes otherwise authorized by the changes clause of this contract, should the Force Protection Condition (FPCON) at any installation or facility change, the Government may require changes in contractor security matters or processes.

2b. for Contractors Who Do Not Require CAC, But Require Access To A Dod Facility Or Installation

Contractor and all associated sub-contractors employees shall comply with adjudication standards and procedures using the National Crime Information Center Interstate Identification Index (NCIC-III) and Terrorist Screening Database (TSDB) (Army Directive 2014-05 / AR 190-13), applicable installation, facility and area commander installation/facility access and local security policies and procedures (provided by government representative, as NCIC and TSDB are available), or, at OCONUS locations, in accordance with status of forces agreements and other theater regulations.

3. Not Used

4. Suspicious Activity Reporting Training (e.g. iWATCH, CorpsWatch, or See Something, Say Something)

The contractor and all associated sub-contractors shall receive a brief/training (provided by the RA) on the local suspicious activity reporting program. This locally developed training will be used to inform employees of the types of behavior to watch for and instruct employees to report suspicious activity to the project manager, security representative or law enforcement entity. This training shall be completed within 30 calendar days of contract award and within 30 calendar days of new employees commencing performance with the results reported to the COR NLT 5 calendar days after the completion of the training.

5. Contractor Employees Who Require Access to Government Information Systems.

Not Applicable

6. OPSEC Standing Operating Procedure/Plan

Not Applicable

7. OPSEC Training

All new contractor employees will complete Level I OPSEC Training within 30 calendar days of their reporting for duty. Additionally, all contractor employees must complete annual OPSEC awareness training. The contractor shall submit certificates of completion for each affected contractor and subcontractor employee, to the COR or to the contracting officer (if a COR is not assigned), within 5 calendar days after completion of training. OPSEC awareness training is available at the following websites: https://www.iad.gov/ioss/ or http://www.cdse.edu/catalog/operations-security.html; or it can be provided by the RA OPSEC Officer in presentation form which will be documented via memorandum.

8. Information Assurance (IA)/Information Technology (IT) Training

Not Applicable

9. Information Assurance (IA)/Information Technology (IT) Certification

Not Applicable

10. Not Used

11. Not Used

12. Handling or Access to Classified Information.

Not Applicable

13. Threat Awareness Reporting Program (TARP) Training

All new contractor employees will complete annual Threat Awareness and Reporting Program (TARP) Training provided by a Counterintelligence Agent, IAW AR 381-12 . The contractor shall submit certificates of completion for each affected contractor and subcontractor employee(s) or a memorandum for the record, to the COR or to the contracting officer (if a COR is not assigned), within 5 calendar days after completion of training. Authorized webbased TARP training for CAC card holders is available at the following website: https://www.us.army.mil/suite/page/655474

## 1.8 GENERAL REQUIREMENTS

Record of Non-Applicability (RONA) or Information Required for General Conformity Review must be completed before project commencement. The Information Required for General Conformity Review Document is enclosed.

## 1.9 CONTRACT DRAWINGS AND SPECIFICATIONS

### 1.9.1 SETS FURNISHED

Utilize the bid drawings and specifications as amended in the performance of the work until the electronic Adobe Acrobat.pdf conformed specifications and contract drawings (i.e., bid drawings that have been posted with all amendment changes) are sent electronically to the Contractor. See paragraph below for contract drawing distribution requirements. The work must conform to the contract drawings, set out in the drawing index, all of which form a part of these specifications. The work must also conform to any of the standard details bound or referenced herein.

### 1.9.2 REPRODUCTION AND DISTRIBUTION

The Government will process no progress payments prior to distribution of electronic contract drawings and conformed specification sets by the Government. The Government will provide the Contractor with a CD-ROM or DVD-ROM or sent electronically containing Adobe Acrobat .pdf contract drawings and conformed specification sets and editable CAD file drawings (format defined in Section 01 33 39.00 10 ADVANCED MODELING (BIM/CIM/GIS/CAD) REQUIREMENTS. Prepare final record or as-built drawings as defined in Section 01 78 39.00 24 AS-BUILT DRAWINGS.

### 1.9.3 NOTIFICATION OF DISCREPANCIES

Check all electronically sent drawing files furnished by the government immediately upon their receipt and promptly notify the Contracting Officer of any discrepancies. Follow dimensions marked on drawings in lieu of scale measurements. Enlarged plans and details govern where the same work is shown at smaller scales. All scales shown are based on a standard drawing size of 22" x 34". If any other size drawings are furnished or plotted adjust the scales accordingly. The Contractor must also advise

his sub-contractors of the above. The Contractor must compare all drawings and verify the figures before laying out the work and will be responsible for any errors which might have been avoided thereby.

1.9.4 OMISSIONS

Omissions from the drawings or specifications or the misdescription of details of work which are manifestly necessary to carry out the intent of the drawings and specifications, or which are customarily performed, does not relieve the Contractor from performing such omitted or misdescribed details of the work but work must be performed as if fully and correctly set forth and described in the drawings and specifications.

1.10 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit items below in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Temporary Fencing Plan; G, RO

SD-02 Shop Drawings

Equipment Room Drawings; G-RO.

1.11 PAYMENT

1.11.1 PROMPT PAYMENT ACT

Pay requests authorized in GENERAL CONDITIONS (CONTRACT CLAUSES) clause: "Payments Under Fixed-Price Construction Contracts", will be paid pursuant to the clause, "Prompt Payment for Construction Contracts". Submit pay requests on ENG Form 93 and 93a, "Payment Estimate-Contract Performance" and "Continuation". All information and substantiation required by the identified contract clauses must be submitted with the ENG Form 93, and the required certification included on the last page of the ENG Form 93a, signed by an authorized contractor official and dated when signed. The designated billing office is the Office of the Area Engineer.

1.11.2 PAYMENT FOR MATERIALS DELIVERED OFFSITE

a. Pursuant to Federal Acquisition Regulation (FAR) 52.232-5, Payments Under Fixed Price Construction Contracts, materials delivered to the contractor at locations other than the site of the work may be taken into consideration in making payments, if included in payment estimates and if all the conditions of the General Provisions are fulfilled. Payment for items delivered to locations other than the work site are limited to:

(1) Materials required by the technical provisions; or

(2) Materials that have been fabricated to the point where they are identifiable to an item of work required under this contract; or

(3) Items specifically listed below in paragraph b.

b. Payment for materials delivered off-site must be made only after receipt of paid invoices listing the value of material and labor incorporated in the items along with a canceled check showing the prime contractor's title to the items delivered off site. Payment for materials delivered off-site must be limited to the following items: None identified.

1.11.3 CONTRACTOR PAYROLL RECORD

Contractor is required to log payrolls for all their own employees and subcontractors utilizing ENG Form 3180. Each subcontractor requires a separate ENG 3180 for their payrolls. The Contractor must maintain the ENG 3180, along with the payrolls, on site and available for review by the Contracting Officer's Representative. Update the ENG 3180's weekly as payrolls are submitted. After making copies for their files, the Contractor is required to submit the originals of each week’s payrolls to the Resident Office. Before final payment, provide the completed ENG 3180’s to the Contracting Officer's Representatives. If the Contractor has elected to use an electronic payroll system, as described in paragraph CONTRACTOR SUPPLY AND USE OF ELECTRONIC SOFTWARE FOR PROCESSING CONSTRUCTION WAGE RATE REQUIREMENTS STATUTE CERTIFIED LABOR PAYROLLS, the payroll inventory produced by the electronic payroll system will satisfy the requirements in this paragraph and FAR 52.222-8, Payrolls and Basic Records.

1.12 AVAILABILITY OF UTILITY SERVICES

All reasonably required amounts of domestic water and electricity will be made available to the Contractor by the Government from existing system outlets and supplies. The Contractor is responsible to , at their own expense, make all temporary connections and install distribution lines. Furnish to the Contracting Officer a complete system layout drawing showing type of materials to be used and method of installation for all temporary electrical systems. Make arrangements with the Using Service, through the Contracting Officer, as to the method of determining the amount of water and electricity to be used by and the method of payment therefore. All temporary lines must be maintainedin a workmanlike manner satisfactory to the Contracting Officer and removed by the Contractor in like manner prior to final acceptance of the construction. Normal quantities of electricity and water used to make final tests of completely installed systems will be furnished by the Government.

1.13 UTILITY SERVICE INTERRUPTIONS

1.13.1 Advance Notice

To request and notify for planned utility outages, the Contractor shall submit written notification on FC FORM 420-E (attached) within the advance notice time stated on the request form. No single outage will exceed 4 hours unless approved in writing. The time and duration of all outages will be coordinated and approved with the Using Agency by the Contracting Officer.

1.13.2 Overtime Work by Base Operating and Maintenance (O&M) Personnel

The normal working hours for Government O&M personnel whose services may be required for utility outages or similar services are from 7:00 a.m. to 3:30 p.m. Overtime work by Government O&M personnel due to Contractor delays in scheduled outages, interruptions of known utility services, or other negligent acts, is the responsibility of the Contractor. Pay the

Government for such additional overtime costs at the existing overtime wage rates established for the Government personnel involved.

1.13.3 Buried Utilities

Coordinate all excavation work including excavation for sign posts, fence posts, and utility poles with the Using Service Facilities Engineer and the telephone company prior to beginning work. Coordinate and apply for dig permits for all excavations and must be renewed every 30 days. Excavation will not be permitted without a digging permit. Digging permits typically only provide indications on where existing utilities are. The Contractor is responsible for locating all existing buried utilities affected by construction activities.

1.14 DIGGING PERMITS AND ROAD CLOSINGS

The Contractor must allow 14 calendar days from date of written application to receive permission to dig and to close roads. Only close roads one lane at a time and allow vehicular traffic to pass through the construction area. Flag work on or near roadways in accordance with the safety requirements in Safety and Health Requirements Manual EM 385-1-1, which forms a part of these specifications. Do not cause blockage of work located along the alert force route and maintain unobstructed access for alert force traffic at all times.

1.15 TIME EXTENSIONS FOR UNUSUALLY SEVERE WEATHER

a. This provision specifies the procedure for the determination of time extensions for unusually severe weather in accordance with the GENERAL CONDITIONS (CONTRACT CLAUSES) clause entitled "Default: (Fixed-Price Construction)." In order for the Contracting Officer to award a time extension under this clause, the following conditions must be satisfied:

(1) The weather experienced at the project site during the contract period must be found to be unusually severe, that is, more severe than the adverse weather anticipated for the project location during any given month.

(2) The unusually severe weather must actually cause a delay to the completion of the project. The delay must be beyond the control and without the fault or negligence of the contractor.

b. The following schedule of monthly anticipated adverse weather delays is based on National Oceanic and Atmospheric Administration (NOAA) or similar data for the project location and will constitute the base line for monthly weather time evaluations. The Contractor's progress schedule must reflect these anticipated adverse weather delays in all weather dependent activities.

MONTHLY ANTICIPATED ADVERSE WEATHER DELAY
WORK DAYS BASED ON (5) DAY WORK WEEK

| | |
|---|---|
| Jan | 5 |
| Feb | 4 |
| Mar | 3 |
| Apr | 3 |
| May | 3 |
| Jun | 3 |

Jul 5
Aug 5
Sep 2
Oct 2
Nov 2
Dec 6

c. Upon acknowledgment of the Notice to Proceed (NTP) and continuing throughout the contract, the contractor will record on the RMS daily CQC report, any occurrence of adverse weather and resultant impact to normally scheduled work, within 24 hours of the event. Actual adverse weather delay days must prevent work on critical activities for 50 percent or more of the contractor's scheduled work day. Describe in the RMS daily CQC reports the critical path item that is being affected and provide the critical path activity number(s) from the current schedule. The COR must acknowledge and accept the agreed upon occurrence of each adverse weather delay in RMS for the delays to be considered as adverse weather delays.

At the end of each month, identify the number of actual adverse weather delay days that includes days impacted by actual adverse weather (even if adverse weather occurred in previous month), calculated chronologically from the first to the last day of each month, and recorded as full days. If the number of actual adverse weather delay days exceeds the number of days anticipated in paragraph b. above, the Contracting Officer will convert any qualifying delays to calendar days, giving full consideration for equivalent fair weather work days, and issue a modification in accordance with the GENERAL CONDITIONS (CONTRACT CLAUSES) clause entitled "Default (Fixed Price Construction)". (ER 415-1-15)

## 1.16 INSURANCE REQUIRED

In accordance with GENERAL CONDITIONS (CONTRACT CLAUSES) clause: "Insurance Work on a Government Installation," procure the following minimum insurance:

| Type | Amount |
|---|---|
| Workmen's Compensation and Employer's Liability Insurance | $100,000 |
| General Liability Insurance | $500,000 per occurrence |
| Automobile Liability Insurance | |
| Bodily injury | $200,000 per person and $500,000 per occurrence |
| Property damage | $ 20,000 per occurrence |

(Coverages per FAR 28.307-2)

## 1.17 SECURITY REQUIREMENTS

### 1.17.1 Contractor's Employee Identification

The Contractor is responsible for furnishing to each employee and for requiring each employee engaged on the work to display such identification as may be approved and directed by the Contracting Officer. Deliver all

prescribed identification immediately be delivered to the Contracting Officer, for cancellation upon release of any employees. When the contract involves work in restricted security areas, only employees who are U.S. citizens will be permitted to enter. Proof of U.S. citizenship is required prior to entry. When required by the Contracting Officer, obtain and submit fingerprints of all persons employed or to be employed on the project. (Based on FAR 52.204-2)

1.17.2 Fort Carson Entry Requirements

All personnel are required to show a Department of Defense (DOD) issued picture ID, Fort Carson Installation Access Control Card, to enter Fort Carson. Specific requirements and exceptions are outlined in the paragraphs below. AT/OPSEC and Real ID Act are additional requirements to other requirements listed herein.

Access restrictions to the base are listed in paragraph: Authorized Access Points below.

All personnel entering Fort Carson are subject to random vehicle searches IAW the Fort Carson Random Antiterrorism Measures Program (RAMP). Motorcycle riders must comply with all Fort Carson requirements for use of appropriate safety equipment.

1.17.2.1 AT/OPSEC

See paragraph: ANTITERRORISM (AT)/OPERATIONS SECURITY (OPSEC) PROVISIONS above.

1.17.2.2 Real ID Act

Contractor is responsible to adhere to the Real ID Act, or any other DOD security requirement(s), when applying for access to the installation, for all prime and subcontracted employees. See https://www.dhs.gov/real-id-enforcement-brief for states with Real ID Act compliant driver's license and other identification requirements.

Personnel who present an ID from a state that is not in compliance and does not have an extension will need to provide a second form of valid photo ID along with their state ID. Acceptable form of ID to be used as a secondary ID are listed below:

U.S. Passport or Passport Card, PIV or PIV-I card issued by the Federal Government, Veterans Health Identification Card issued by the Department of Veterans Affairs, DHS "Trusted Traveler" cards (Global Entry, NEXUS, SENTRI, FAST), TWIC (Transportation Worker Identification Credential), Merchant Mariner Card issued by the DHS/U.S. Coast Guard, Driver's License issued by the U.S. Department of State, Border Crossing Card (Form DSP-150), U.S. Certificate of Naturalization or Certificate of Citizenship (Form N-550), U.S. Permanent Resident Alien Card (Form I-551), Native American Tribal photo ID, Current University/College ID card containing a photograph, name and expiration date.

Identification Card issued by a federal, State or Local Government agency provided it contains a photograph and biographic information such as name, date of birth, gender, height, eye color and address.

1.17.2.3 Foreign Nationals (FN)

Foreign Nationals (FN) are persons that are not U.S. citizens, INS Naturalized Immigrants, or do not possess a valid DOD Identification Card. The Contractor is responsible for any FN worker or visitor and ensures that that each FN worker or visitor possesses a valid Passport or valid INS Visa/paperwork on their person. No other identification will be accepted. FN workers or visitors are required to be under escort by a DOD Identification Card bearing Adult at all times. The Government will not be responsible for providing escort services. Any FN workers and visitors are required to be processed through base security upon each entry to Fort Carson. The Government reserves the right to deny access to any FN worker or visitor that fails to comply with access procedures or does not have proper paperwork.

1.17.3 Fort Carson Installation Access Control Card

Contractor employees that do not have a valid CAC, retired military ID card, or military dependent ID card are required to obtain a Fort Carson Installation Access Control Card, which includes a photo. The following steps are required to obtain a Fort Carson Installation Access Control Card.

1) Contractor requests FC Form 2036-E Request for Fort Carson Installation Access Control Card from the COR and complete the form. The form will not be accepted handwritten. It must be filled out electronically.

2) Contractor provides the completed form in PDF format electrically by email to the COR for approval and digital signature. The sponsor listed on FC Form 2036-E is required to be the Prime Contractor. As the sponsor, the Prime Contractor is responsible for 1) reviewing the FC Form 2036-E or correctness and completeness, 2) maintaining a list of personnel with Installation Access Control Cards for the project, 3) returning the Installation Access Control Cards with then they expire, and 4) collecting and returning Installation Access Control Cards when personnel are fired or quit.

3) The COR will verify need for Fort Carson access, digitally sign, and email back to the Contractor. Digitally Signed FC Form 2036-Es are valid for initial issuance of a pass for 60 days from the date it is signed by the certifying authority.

4) After receiving the digitally signed FC Form 2036-E, the Contractor employee shall print a copy and take it to the Visitor Center at Gate 1 (Bldg 6012) for NCIC III check. In addition to the printed digitally signed FC Form 2036-E, each contractor employee is required to bring an accepted ID, vehicle registration and proof of insurance, and be prepared to wait until while the NCIC III check is done. Acceptable forms of ID include:

a. Valid state driver's license or identification card,
b. Locally issued installation badge and/or pass,
c. Valid U.S. passport,
d. DA Form 1602 (Civilian Identification and Gold Star Family, School District Employees ID (only until the installation has a local produced badge),
e. Transportation Security Agency (TSA) issued Transportation Worker Identification Credential (TWIC),
f. DD Form 2574, Armed Forces Exchange Services ID and Privilege,

g. Air Force (AF) Form 354, Civilian ID,
h. DD Form 1934, Geneva Convention ID card for Medical and Religious,
i. DD Form 2764, US DoD/Uniformed Services Civilian Geneva Convention ID, or
j. DD Form 489, Geneva Convention ID card for Civilians.

In most cases, a Fort Carson Installation Access Control Card with photo will be issued upon completion of the NCIC III check. The expiration date on the card will be for the duration of the contract or 365 days, whichever is less.

Possible reasons to be denied access under the NCIC III check include, but are not limited to: felony in the last 10 years, rape, child molestation, child pornography, and assault and Fire arm related crimes, and outstanding arrest warrants.

During the prescreening, if the contract employee fails the background check, they may be detained or not allowed on post based on the failure. If they have an active warrant, they will be detained and turned over to local law enforcement.

5) If access to Fort Carson is denied, contractor employee can submit a Fort Carson Access Control Denial Waiver Application. USACE will only endorse waiver applications under extenuating circumstances.

1.17.4 Visitor Day Pass

For Visitor access, use Gate 1 Visitor Center where the NCIC check will be done and a Day Pass issued. A State issued or other valid picture ID is required. This also applies to all those who have a valid ID, but have temporarily misplaced it.

1.17.5 Vehicle Registration Requirements and Documentation

1.17.5.1 General Requirements

Entry of motor vehicles onto the Fort Carson is a privilege permitted by the Installation Commander. This privilege may be revoked if the driver fails to comply with applicable Fort Carson regulations and requirements contained herein. NO ONE has the "right" to drive on a military installation, regardless of if military or civilian. In any cases not covered by Fort Carson regulations, the traffic laws of the State of Colorado will apply.

The Contractor insures that all incoming personnel (prime and subcontract) operating motor vehicles on Fort Carson are familiar with Colorado Motor Vehicle Revised Statute 42-4-310 (Requirements for the state emissions test).

1.17.5.2 Authorized Access Points (Cantonment Area)

Contractor employees (Prime and Subcontractor) with a Fort Carson Installation Access Control Card or valid Department of Defense (DOD) issued photo identification card may enter through any of the access points listed below. The far left lane for Gates 1 and 3 are reserved for DOD ID card holders. Guests can easily access Gate #1 after obtaining a day pass at the Gate #1 Visitor Center. The Government reserves the right to conduct a 100 percent ID check at any time. Gate restrictions are

listed below:

(1) Gate #1 - Nelson Boulevard - 24-hour access (two-way gate). This is the main gate located Highway #115.
(2) Gate #2 - O'Connell Boulevard - when open (two-way gate).
(3) Gate #3 - Chiles Avenue - 24-hour access (for commercial vehicles)
(4) Gate #4 - Barkeley Avenue - 24-hour access (two-way gate)
(5) Gate #5 - Titus Boulevard (Golf Course) - when open (two-way gate)
(6) Gate #6 - Wilderness Road - when open (two way gate)
(7) Gate #20 - Specker Avenue - 24-hour access (two-way gate).

1.17.5.2.1 Commercial Vehicle Access

Commercial vehicles are required to use Gate #3 for access, where the NCIC check will be done in lane. One-time access will be granted. Drivers will not be issued a day pass at Gate #3, so drivers will need to have a background check done EACH TIME they enter through Gate #3.

Commercial Vehicles permitted to use other than Gate #3 for access include:

(1) Normally intended for passenger use (such as a courtesy car).
(2) Vans that do not exceed 15-passenger capacity.
(3) Pick-up trucks that do not exceed 1-ton cargo capacity (such as the Ford F-350 Superduty or Dodge Ram 3500) when vehicle is transporting personnel. If pick-up trucks are transporting equipment or supplies, use Gate #3 for access.
(4) Taxicabs if transporting a passenger in possession of a valid DOD issued ID card.
(5) As approved by the Contacting Officer and the Security and Access Control Division.
(6) Gates 2, 4, 5 and 20 cannot be used for Commercial Vehicle access unless the driver has a Fort Carson Installation Access Control Card.

1.17.5.3 Types of Vehicles

a. Privately owned or leased motor vehicles (POVs) include automobiles, motorcycles, motor scooters, motorized bicycles with an engine displacement of 50cc or higher, recreational vehicles and watercraft that are owned by Contractor personnel (prime or subcontract). See paragraph: Motor Vehicle Operator Access Documentation below for vehicle registration requirements.

b. Commercial Vehicles are Construction Equipment vehicles, any vehicle which passenger capacity exceeds 15 passengers, any truck that has a cargo capacity greater than 1 ton, any vehicle towing a trailer, and any vehicle with more than two axles.

c. Commercial construction vehicles are defined as oversized commercial vehicles with the primary job of transporting large quantities of construction materials (e.g. concrete trucks, asphalt trucks, flatbed tractor-trailer trucks transporting pre-fabricated building materials).

1.17.5.4 Motor Vehicle Operator Access Documentation

All individuals that wish to operate a vehicle on Fort Carson must have the following proper documentation physically in their possession. Expired documents will not be accepted; no exceptions to this policy are authorized.

(1) A valid driver's license issued in the United States or a US Territory.
(2) A valid vehicle registration issued in the US or a US Territory.
(3) Proof of valid insurance coverage on the vehicle (must show policy number and expiration date to be considered valid.).
(4) For Motorcycles only, a motor safety card endorsed by the Motor Safety Foundation (MSF), and motorcycle endorsement on driver's license.

1.17.6 TEMPORARY FENCING PLAN

Contractor will be required to maintain the security of the installation perimeter to a level that is currently found on-site. The contractor will also be required to submit a temporary fencing plan before demolition of existing perimeter fence begins.

1.18 CONTRACTOR QUALITY CONTROL (CQC)

See Section 01 45 00.00 10 QUALITY CONTROL.

1.19 NONDOMESTIC CONSTRUCTION MATERIALS

The list of excepted nondomestic construction materials or their components referenced in the Buy American Construction Material Contract Clauses includes the list set forth in paragraph 25.104 of the Federal Acquisition Regulation.

1.20 DAILY WORK SCHEDULES AND WEEKLY COORDINATION MEETINGS

In order to closely coordinate work under this contract, prepare a written agenda/meeting minutes and attend a weekly coordination meeting with the Contracting Officer and Using Service at which time the Contractor must submit for coordination and approval, their proposed daily work schedule for the next two week period. Provide a copy of modifications (MODs), Serial Letters, Requests for Information (RFIs)and any other information that is needed in the minutes of the meeting. Include required temporary utility services, time and duration of interruptions, and protection of adjoining areas with the Contractor's proposed 2-week work schedule. At this meeting, the Contractor must also submit their schedule of proposed dates and times of all preparatory inspections to be performed during the next 2 weeks. The items of work listed on the proposed 2-week schedule are to be keyed to the NAS by activity number and description for each activity anticipated to be performed during the next 2-week period. Coordination action by the Contracting Officer relative to these schedules will be accomplished during these weekly meetings. Daily reports must be completed and given to the Contracting Officer or Representative within 24 hours of work. All official correspondence such as serial letters and RFIs, with attachments are to be provided in one hardcopy original with original signatures and one electronic (Adobe pdf format) copy by email. The Government will consider the correspondence to be received when the official hardcopy or electronic copy is received by the designated office.

1.21 AS-BUILT DRAWINGS

See SECTION 01 78 39.00 24 - AS-BUILT DRAWINGS.

1.22 SIGN

On commencement of work on this project, furnish and erect the temporary

sign in the location selected by the Contracting Officer near the project site. Maintain the sign in good condition through the project construction period. Upon completion of the project remove the sign from the premises. The project sign must conform to standard drawing bound herein. A decal of the "Engineer Castle" will be furnished the Contractor upon request.

1.23 EQUIPMENT ROOM DRAWINGS

Prior to construction, prepare and submit room plans for all mechanical, electrical, and communication rooms or similar areas. The plans must be consolidated for all trades, be to scale, and show all pertinent structural features. In addition, other items such as doors, windows, and cabinets required for installation and which will affect the available space, must be shown. All mechanical and electrical equipment and accessories must be shown to scale in plan and elevation and/or section in their installed positions. All duct work and piping must be shown.

1.24 CONTRACTOR FURNISHED EQUIPMENT DATA

See Section 01 78 36.00 24 WARRANTY OF CONSTRUCTION for Contractor Furnished Equipment Data to be submitted as part of the Warranty Equipment Booklet.

1.25 PARTNERING

a. The Government intends to encourage the formation of a cohesive partnership with the Contractor. This partnership will be structured to draw on the strengths of each organization to identify and achieve reciprocal goals. The objective is effective contract performance in achieving completion within budget, on schedule and in accordance with plans and specifications. This partnership between the Contractor and the Government will be voluntary and its implementation will not be part of the contract requirements nor will it result in a change to contract price or terms.

b. It is anticipated that immediately after the preconstruction conference, the appropriate Contractor's key personnel and Government key personnel will attend a 2-3 hours informal team building workshop at the Area or Resident Office (as directed).

1.26 PROFIT

a. Use the weighted guidelines method of determining profit on any equitable adjustment change order or modification issued under this contract. The profit factors must be as follows:

| Factor | Rate | Weight | Value |
|---|---|---|---|
| Degree of Risk | 20 | See Item | |
| Relative difficulty of work | 15 | b. below | |
| Size of Job | 15 | | |
| Period of performance | 15 | | |
| Contractor's investment | 5 | | |
| Assistance by Government | 5 | | |
| Subcontracting | 25 | | |
| | 100 | | |

b. Based on the circumstances of each procurement action, each of the above factors must be weighted from .03 to .12 as indicated below. Obtain

the value by multiplying the rate by the weight. The value column when totaled indicates the fair and reasonable profit percentage under the circumstances of the particular procurement.

(1) Degree of Risk. Where the work involves no risk or the degree of risk is very small, the weighting should be .03; as the degree of risk increases, the weighting should be increased up to a maximum of .12. Lump sum items will have, generally, a higher weighted value than the unit price items for which quantities are provided. Other things to consider: the portion of the work to be done by subcontractors, nature of work, where work is to be performed, reasonableness of negotiated costs, amount of labor included in costs, and whether the negotiation is before or after performance of work.

(2) Relative Difficulty of Work. If the work is most difficult and complex, the weighting should be .12 and should be proportionately reduced to .03 on the simplest of jobs. This factor is tied in to some extent with the degree of risk. Some things to consider: the nature of the work, by whom it is to be done, where, and what is the time schedule.

(3) Size of Job. All work not in excess of $100,000 shall be weighted at .12. Work estimated between $100,000 and $5,000,000 shall be proportionately weighted from .12 to .05.

(4) Periods of Performance. Jobs in excess of 24 months are to be weighted at .12. Jobs of lesser duration are to be proportionately weighted to a minimum of .03 for jobs not to exceed 30 days. No weight where additional time not required.

(5) Contractor's Investment. To be weighted from .03 to .12 on the basis of below average, average, and above average. Things to consider: amount of subcontracting, mobilization payment item, Government furnished property, equipment and facilities, and expediting assistance.

(6) Assistance by Government. To be weighted from .12 to .03 on the basis of average to above average. Things to consider: use of Government-owned property, equipment and facilities, and expediting assistance.

(7) Subcontracting. To be weighted inversely proportional to the amount of subcontracting. Where 80 percent or more of the work is to be subcontracted, the weighting is to be .03 and such weighting proportionately increased to .12 where all the work is performed by the Contractor's own forces.

## 1.27 LABOR CONDITIONS APPLICABLE TO TEMPORARY FACILITIES

It is the position of the Department of Defense that the Davis-Bacon Act, 40 U.S.C. 276a is applicable to temporary facilities such as job headquarters, tool yards, batch plants, borrow pits, sandpits, rock quarries, and similar operations, provided they are dedicated exclusively, or nearly so, to performance of the contract or project, and provided they are adjacent or virtually adjacent to the site of the work and are established after receipt of the proposal or bid. Clause "Payrolls and Basic Records" of the GENERAL CONDITIONS (CONTRACT CLAUSES) is applicable to such operations.

1.28 DRAWING SCALES

All scales shown are based on a standard drawing size of 22" x 34". If any other size drawings are furnished or plotted, the contractor adjust the scales accordingly. The Contractor must also advise their sub-contractors of the above.

1.29 FEDERAL HOLIDAYS

The following Federal legal holidays are observed by this installation:

| | |
|---|---|
| New Year's Day | 1 January |
| Martin Luther King's Birthday | Third Monday in January |
| President's Day | Third Monday in February |
| Memorial Day | Last Monday in May |
| Juneteenth | 19 June |
| Independence Day | 4 July |
| Labor Day | First Monday in September |
| Columbus Day | Second Monday in October |
| Veterans Day | 11 November |
| Thanksgiving Day | Fourth Thursday in November |
| Christmas Day | 25 December |

If a wage determination applies the number of holidays specified on it, it has priority over this requirement.

1.30 BASE HOURS

Base operation hours are 6:00 a.m. to 6:00 p.m. daily (Monday through Friday), excluding federal holidays. Access to the base during other times must be requested in writing from the Contracting Officer and will be granted only for extenuating circumstances. Federal Holidays and weekends are considered as scheduled non-workdays.

**REQUEST FOR A FORT CARSON INSTALLATION ACCESS CONTROL CARD** *(Required for all Pass Requests greater than 24 hours)*
*(DES is the proponent; the approving authority is DTM 09-012, December 8, 2009)*

**Privacy Act Statement**

**Authority:** 10 U.S.C. 3013, Secretary of the Army; Army Regulation 190-13, The Army Physical Security Program and E.O. 9397 (SSN).
**Purpose(s):** To support Department of the Army physical security and access control programs; Information Assurance program; to record personal data and vehicle information registered with the Department of the Army; to provide a record of security/access badges issued; to restrict entry to installations and activities; to ensure positive identification of personnel authorized access to restricted areas; to maintain accountability for issuance and disposition of security/access badges and for producing installation management reports.
**Routine uses:** In addition to those disclosures generally permitted under 5 U.S.C. 552a(b) of the Privacy Act, these records or information contained therein may specifically be disclosed outside the DoD as a routine use pursuant to 5 U.S.C. 552a(b)(3) as follows: The DoD 'Blanket Routine Uses' also apply to this system of records.
**Disclosure:** Disclosure of SSN and other personal information is voluntary; however, failure provide the requested information can result in denial of access to the military installation.

**APPLICANT INFORMATION**

*FC Reg 420-19

Facilities Engineering
# FORT CARSON SCHEDULED UTILITY OUTAGE REQUESTS (SUOR)

**History**. This publication is a major revision.

**Summary**. This regulation provides policy guidance for implementing SUOR procedures, establishes responsibilities for ensuring timely and proper coordination of work projects and utility outages or connections affecting the routine activities of the installation, and enhances the safety and well-being of personnel on the installation.

**Proponent and exception authority.** The proponent for this regulation is the Directorate of Public Works (DPW). The proponent has the authority to approve exceptions or waivers to this regulation that are consistent with controlling law and regulations.

**Applicability**. This regulation applies to units and activities assigned and/or attached to Fort Carson (FC), Pinon Canyon Maneuver Site (PCMS), government staff elements, military units, civilian contractors, tenant units and activities located on FC or PCMS, and any other entity interested in utility outages or electrical distribution system work clearances (Hot Line Holds) for work performed on FC and PCMS. This includes any activities and persons involved in construction and/or repairs to real property facilities or private property facilities that require implementing scheduled utility outages. This does not apply to unscheduled emergency utility outages caused by emergencies, personal negligence, outside agencies, or acts of nature.

**Army management control process.** This regulation does not contain any management control provisions.

**Supplementation.** Supplementation of this regulation and the establishment of command and local forms are prohibited without prior approval from the DPW, ATTN: Operations & Maintenance Division (O&MD), 5050 Tevis St, Fort Carson, CO 80913.

**Suggested improvements.** Users are invited to send comments and suggested improvements on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to DPW ATTN: Operations & Maintenance Division, 5050 Tevis St, Fort Carson, CO 80913.

**Chapter 1**
**Introduction**

**1-1. Purpose.**

a. Establishes policies regarding scheduled utility outages, connections, road closures or fire flow testing and the response times required for requests submittals for the SUOR.

b. Sets forth procedural steps for obtaining a SUOR.

c. Establishes the DPW, O&MD as responsible for schedules, utility outages, coordination, and approval.

d. Covers the following special precautionary measures:

(1) Potentially dangerous working conditions.

(2) Disruption of utility services such as vehicular, rail, or aircraft traffic flow, traffic signaling, and/or routine activities of the installation and private entities.

(3) Disruption of other contracted activities on the installation.

(4) Disruption of fire protection services.

e. Establishes a central office and point of contact for the control and coordination of scheduled utility outages.

f. Requires compliance by contractors and private entities performing construction work on the installation.

g. Requires submittal of required action on FC Form 420-E (Fort Carson Utility Outage/Connection Request).

**1-2. References.**

Required and related publications and prescribed and referenced forms are in the appendix.

**1-3. Explanation of abbreviations and forms.**

Abbreviations and terms used in this publication are explained in the glossary.

**Chapter 2**
**Responsibilities**

a. Agencies, activities, and proponents should contact the appropriate project manager (government representative) to coordinate a scheduled utility outage.

b. The DPW will:

(1) Delegate approval authority for scheduled utility outages to the Base Operations and Maintenance (O&M) Contractor.

(2) Provide necessary resources to the Base O&M Contractor for performing the required utility outages.

(3) Provide necessary funding to support or perform the scheduled utility outage during normal duty hours. This will include relighting of pilot lights, programming sensor units, etc. Requests for outages after normal duty hours or on weekends will be funded by the requestor, unless it is determined by DPW, O&MD necessary to minimize occupant impact.

(4) Appoint project managers within the DPW as follows:

(a) DPW Engineering Division Quality Assurance; DPW projects.

(b) DPW Engineering Division Quality Assurance or Corps of Engineers for Military Construction, Army (MCA), major nonappropriated fund, and major tenant construction contracts.

(c) Troop Construction Office; troop projects.

(d) Housing Division; privatized Family housing contracts.

(e) DPW Base O&M Contractor; in-house repair work.

(f) DPW Engineering Division Quality Assurance or Troop Construction Office; self-help projects.

(g) The appointed government project manager will initiate, coordinate, notify affected parties and sign the FC Form 420-E.

c. The Base O&M Contractor will perform the following:

(1) A means of scheduling and completing, by date and time, all requested scheduled utility outages and resumption of utilities.

(2) Energize and de-energize all FC and PCMS utilities.

(3) Appoint project managers to perform maintenance, repair, or construction projects for which the Base O&M Contractor is to perform and which will require a FC Form 420-E.

d. The Network Enterprise Center (NEC) will appoint a project manager for coordination of utility outages concerning U.S. West/QWEST, AT&T, FC and PCMS computer server connections, or other communications or cable agencies.

**Chapter 3**
**Procedures**

a. Project managers will:

(1) Identify the need for a scheduled utility outage, connection, road closure, or fire flow test in the early stages of project development.

(2) Assure an approved DA Form 4283 (Facilities Engineering Work Request) or DD Form 1391 (FY__ Military Construction Project Data) is on file with DPW.

(3) Coordinate with all installation and tenant staff agencies, and private companies affected by outage.

(4) Ensure a completed SUOR is submitted to the Base O&M Contractor at BLDG 221 no later than three business days prior to the required outage. Normal business hours are 0700 to 1530, Monday through Friday, excluding federal holidays. The completed FC Form 420-E includes a description of the outage, and notification of all affected agencies/customers, and traffic control plan, if applicable. If a utility outage is to be scheduled on a weekend or after normal duty hours, seven working days is required. If a utility outage affects living quarters (barracks or housing), five working days is required.

(5) E-mail major subordinate Command Sergeant Majors concerning troop billet outages and facility commanders for other facility outages.

(6) Publish timely notices in the installation newspaper for all outages that will affect medical, dining, installation information, and residential facilities.

(7) Whenever possible, scheduled upcoming utility outages announced at Command and Staff, Town Hall Meetings, Mountain Post Action Council, and Quality Master Planning Meetings.

(8) Notify the Union President of the American Federal of Government Employees for outages that affect bargaining union employees in accordance with Article 7.

(9) When applicable, ensure that a Traffic Control Plan is submitted for review and approval by DPW Traffic Planning and Engineering. Traffic Control Plans will be in accordance with the Manual on Uniform Traffic Control Devices.

(10) Ensure a negative Bacteriological Testing (Bac-T) result. The Bac-T results are valid only five calendar days from the time the sample was taken. Failure to active the water line within five calendar days will require a new Bac-T.

b. The DPW, O&MD will:

(1) Delegate coordination and approval of submitted scheduled utility outages to the Base O&M Contractor.

(2) Coordinate with DPW, Business Operations & Integration Division if outage will affect more than 25% of the post for more than four hours.

(3) Submit any required funding documents for implementation of scheduled utility outages, if applicable.

(4) Provide guidance and assistance to the Base O&M Contractor as necessary.

c. The Base O&M Contractor will:

(1) Provide all required resources to de-energize and re-energize installation utilities and assure all systems are functional. This does not include telephone, computer or cable systems, or other private telecommunications systems.

(2) Provide final labor, material, and equipment costs to O&MD, when required.

(3) Ensure required testing, utility quality and bacteriological testing is completed and acceptable, before the affected utility service is restored.

(4) Provide the Electrical Distribution System Work Clearances (Hot Line Hold) Procedures. The Hot Line Hold order is an authorization issued by the Base O&M Contractor's High Voltage Supervisor (Switching Authority) to a qualified employee or contractor in charge, allowing work to be done on or near an energized line or piece of equipment.

d. The qualified employee or contractor will:

(1) At a minimum of three working days prior to requested action, contact the High Volt Supervisor with request, to include time and date, work to be accomplished and location.

(2) Stay in radio or phone contact with the switching authority to assure hold procedures have been incorporated before starting work.

(3) Notify the switching authority when work has been completed and to remove the hold.

e. The Switching Authority will:

(1) Provide all required resources for requested support.

(2) When protective devises are so equipped, automatic reclosing controls will be deactivated and all controls which can be operated to re-energize the circuit in the event of a trip-out will be tagged with a properly filled-out Hot Line Hold Tags.

**Chapter 4**
**Emergency Processing Procedures**

a. In case of emergency situations, such as ruptures/leakage of pipelines, explosions, fires, and similar instances where immediate action is necessary and processing of a FC Form 420-E is not practical, the government project manager will:

(1) Notify the DPW O&MD COR of required corrective actions at 526-9262.

(2) Notify the Base O&M Contractor Repair Order Desk at 526-5345, for service orders.

(3) Provide reimbursement funds to the O&MD, through the Resource Management Office for corrective action costs.

b. The COR will direct the Base O&M Contractor to support the repair as required.

# FORT CARSON UTILITY OUTAGE/CONNECTION REQUEST

*(Read instructions on Page 2 of this form. FC REG 420-19 requires that the government receive 3 business days notice on outages performed during normal working hours. If outages require work to be performed during the evening or on weekends; then, 7 days notice is required. Living quarters require a 5 day minimum notice.)*

1. Project Contract Numberor Approved Work Request Number:

2. Requester: Name: _____ Phone: _____

FAX: _____ Email: _____

Company/Unit: _____

3. Work Description: _____

Location: _____

Date of Outage or Connection: _____ Time of Outage or Connection: _____

4. Type of Outage or Connection: ☐ HOT TAP ☐ OUTAGE ☐ ENERGIZE ☐ FIRE FLOW TEST ☐ WATER ☐ SEWER

☐ GAS ☐ ELECTRIC ☐ STEAM/HTHW ☐ CHILLED WATER ☐ ROAD ☐ FIRE PROTECTION ☐ OTHER

5. Number of facilities affected: _____

BLDG# _____ BLDG POC NAME: _____ Phone: _____

Signature: _____ Email: _____ Date: _____

BLDG# _____ BLDG POC NAME: _____ Phone: _____

Signature: _____ Email: _____ Date: _____

BLDG# _____ BLDG POC NAME: _____ Phone: _____

Signature: _____ Email: _____ Date: _____

(If additional facilities are affected, include information on a separate list and attach to this request. Include BLDG#, POC (printed name), signature, phone number, email, and date.)

6. Wll the contractor provide temporary utilities to support this outage? ☐ YES ☐ NO ☐ N/A

7. Wll the contractor provide portable latrines to support this outage? ☐ YES ☐ NO ☐ N/A

8. Does the work require traffic control, detour, or road/lane closure? ☐ YES ☐ NO ☐ N/A If yes, DPW, Traffic Engineering Section approval required.

9. Government Representative's Name (print): _____ Phone: _____

Email: _____ Signature: _____ Date: _____

10. Approval Request: Government representative must coordinate and obtain the signature of the appropriate POC for this request to be approved. As-built, red line, or 1 line drawings and traffic control planswill be submitted with this request. A copy of all required testing results (e.g., Bac-T's, pressure tests, etc.) will be provided to the approval POC before any new utility line will be activated or energized. Submit approved form to the Fort Carson Dig Permit Office at BLDG 1225; phone 719-526-3089

Electric (Primary/Secondary), Fire Sprinkler, and Alarm Systems: Contact: Electrical Services Supervisor Phone: 719-302-0160; BLDG 221 Electric Shop

Road/Parking lot closure or detour: Contact: DPW, Traffic Engineering Section Phone 719-526-9267; BLDG 1219 Room 117

☐ Approved: ☐ Disapproved

Signature: _____ Date: _____

## INSTRUCTIONS

### SECTION 1

The Requester provides project name, contract number, and work order number or project number from DA 4283 or DD 1391.

### SECTION 2

The Requester provides all contact information (e.g., name, office, and cell phones, fax number, e-mail address, and company name/requesting unit).

### SECTION 3

The Requester provides a detailed description of the work that requires this utility outage, connection, electric energize, hot tap, or other (road closure, fire hydrant flow test, etc.). The date of the outage or connection. The time of the ouage or connection. All outages or connections will be performed during regular business hours 0730 to 1530, Monday through Friday (excluding Federal holidays). Any outages or connections after the times listed will be handled on a case by case basis. Approval/disapproval of this request shall be coordinated with the DPW, Base Operations and Maintenance Contractor, Fort Carson Support Services (FCSS), seven (7) days prior to the scheduled outage or connection.

### SECTION 4

The Requester identifies the type of outage or connection. Identifies the utility affected by the outage or connection.

### SECTION 5

The Requester or Project Government Representative provides a list of buildings affected by the outage or connection. Obtain the BLDG POC's name (printed), signature, phone number, and date. Include any requests the buildings to support this outage or connection.

### SECTION 6

The Requester or Project Government Representative identifies if the contractor will provide temporary utility support to the affected buildings to support this outage or connection.

### SECTION 7

The Requester or Project Government Representative identifies if the contractor will provide portable latrines to the affected buildings to support this outage or connection.

### SECTION 8

The Requester identifies if traffic control, detour, or road/parking lot closure is required. If "Yes" is checked, you must contact the DPW, Traffic Engineering Section for approval. A detailed traffic control plan is required.

### SECTION 9

The Government Representative provides all the information required in Section 9 of this form. The Government Representative shall verify that sections 1 through 8 have been completed before signing this section.

### SECTION 10

The Government Representative obtains the request approval from the appropriate utility POC by following the directions of Section 10 of this form. As-built, red line, or 1 line drawing will be submitted with the request. Submit approved and completed form to the Fort Carson Dig Permit Office; phone 719-526-3089, Building 1225.

DEPARTMENT OF THE ARMY
HEADQUARTERS FORT CARSON
Fort Carson, Colorado 80913-4145
15 January 2014

*FC REG 420-20

Facilities Engineering
FORT CARSON DIG PERMIT (FCDP)

**History.** This publication is a major revision.

**Summary.** This regulation provides policy guidance for implementing FCDP procedures and establishes responsibilities for ensuring timely and proper coordination of work projects affecting routine activities on the installation. Additionally, it enhances the safety and well-being of all persons on the installation and protects underground utilities.

**Applicability.** This regulation applies to organizations assigned and/or attached to Fort Carson (FC), Pinion Canyon Maneuver Site (PCMS), government staff elements, military units, and civilian contractors interested in ensuring timely and proper coordination of work projects affecting the routine activities of the installation or obtaining utility locates for a particular job site excavation. This includes tenant units, activities, and persons involved in construction on FC and PCMS that requires implementing special precautionary measures. However, this does not apply to training exercises on ranges or training areas that are covered in FC Reg 385-63 (Firing Ammunition for Training, Target Practice, Administration & Control of Ranges and Training Areas), which explains procedures for obtaining permission to excavate on ranges and training areas for training purposes.

**Proponent and exception authority.** The proponent of this regulation is the Directorate of Public Works (DPW), ATTN: Operations and Maintenance Division (O&MD). The proponent has the authority to approve exceptions or waivers to this regulation that are consistent with controlling laws and regulations.

**Army management control process.** This regulation does not contain any management control provisions.

**Supplementation.** Supplementation of this regulation and the establishment of command and local forms are prohibited without prior approval from DPW, ATTN: O&MD, 1626 Evans St, Fort Carson, CO 80913.

**Suggested improvements.** Users are invited to send comments and suggested improvements on DA Form 2028 (Recommended Changes to Publications and Blank Forms) directly to DPW, ATTN: O&MD, 1626 Evans St, Fort Carson, CO 80913.

Appendix B
Dig Permit Process Flow Chart for Other than Training Ranges…… 09

Glossary…….. 10-11

**Chapter 1**
**Introduction**

**1-1. Purpose.**

a. Establishes policies regarding response time requests for locating and marking government-owned utilities, prior to any ground penetrations.

b. Establishes steps for obtaining a Fort Carson Dig Permit (FCDP) for all companies, units, or organizations performing work involving any type of ground penetration at any depth.

c. Provides delegated authority for permit approval from the DPW, O&MD to the Base Operations and Maintenance Contractor's Dig Permit Coordinator (DPC). The DPC (located in BLDG 1225 at 1649 Evans St) will act as an interface and is responsible for assisting in preparation, processing, and approval of all active dig permits. The DPW, O&MD is responsible for utility outages and road closures. See FC Reg 420-19 (Fort Carson Scheduled Utility Outage Request).

d. Explains utility protection concepts, laws, and the installation implementation of those concepts.

e. Provides concepts for:

(1) Protection of buried utility systems; a major concern of utility owners.

(2) Protection of life and property; a major concern of government. Several states have enacted laws that provide detailed rules and guidance to excavators and utility owners. This regulation is consistent with the concepts of protection of life and property on FC.

f. Covers the following special precautionary measures:

(1) Excavation by hand, mechanical equipment, or explosives.

(2) Potentially hazardous working conditions.

(3) Disruption of utility services, vehicular, rail, aircraft traffic flow, or routine activities on the installation.

(4) Environmental clearance in some cases.

g. Establishes a central office and a point of contact for the control of permits and for coordinating government-owned utility locates.

h. Provides information on commercial utilities known to be on FC and telephone numbers for obtaining clearance.

i. Requires compliance of contractors performing construction work on the installation.

**1-2. References.**

Required and related publications and prescribed and references forms are listed in Appendix A.

**1-3. Explanation of abbreviations and terms.**

Abbreviations and terms used in this publication are explained in the glossary.

## Chapter 2
## Responsibilities

a. The DPW:

(1) Has approval authority for permits published by DPW, Work Control Office to the Base O&MD Contractor.

(2) Will provide necessary resources through the DPW, Base O&MD Contractor for controlling work clearance requests and a locator team for spotting and marking DPW-owned underground utilities.

(3) Will appoint government representatives within DPW for the following:

(a) Sustainment Restoration and Maintenance funded construction projects.

(b) Military Construction projects.

(c) Troop Construction projects.

b. The Directorate of Plans, Training, Mobilization, and Security (DPTMS):

DPTMS, Range Operations is the proponent for Dig Permits for range areas forward of any range firing line and for training lands at both FC and PCMS. DPTMS, Range Operations will approve and provide oversight for Dig Permits in these areas of the installation. Refer to FC Reg 385-63 for more information when requesting a Dig Permit approval on training lands and range areas forward of firing lines. For any utility outage requests or for connecting and disconnecting any utilities for any reason, submit a FC Form 420-E (Fort Carson Utility Outage/Connection Request).

c. The Network Enterprise Center (NEC):

(1) Will appoint a project manager for maintenance, repair, or construction projects to be accomplished by the American Warrior Network, Qwest, American Telephone & Telegraph (AT&T), Cablevision, or other voice and/or data type agencies.

(2) Will provide marking and spotting of NEC-owned underground utilities.

d. The Directorate of Family, Morale, Welfare, and Recreation will appoint a project manager for Non-Appropriated Fund and Army Air Force Exchange Service maintenance, repair, or construction projects requiring a FCDP.

e. The government construction representatives or representatives from the organization performing the work will:

(1) Identify the need for a FCDP or outage request in the early stages of project development. A DPW approved project DA Form 4283 (Facilities Engineering Work Request) or a U.S. Army Corp of Engineers (COE) contract number is required prior to initiating a FCDP. For organizations that are repairing an existing underground utility, an approved repair service order through their organization can be used in lieu of a DA Form 4283. These organizations include the following:

(a) Housing Contractor.

(b) DPW, O&MD Contractor.

(c) Hospital Maintenance Contractor.

(d) NEC.

(e) AT&T.

(f) Baja Broadband.

(g) Altech Services Inc. (ASI).

(h) American Warrior Network.

(i) Qwest.

(2) Submit a FC Form 86-E (Facilities Engineering Dig Permit Request) no earlier than 30 days or less than 10 working days prior to working on utility locates. For utility outage requests or road closures, see FC Reg 420-19.

(3) Include a map or sketch of the area considered for government utility locate and a copy of the approved DA Form 4283 or COE contract number for all FCDP's. A DA Form 4283, COE Contract Number, and an approved FCDP are required when any digging is involved with the project. The area of proposed excavation will be pre-marked in white with flags, stakes, etc. The area will not exceed the amount of work that can be accomplished within a 30 day period. This is the limitation of the FCDP. If more time is required, a new FCDP will be needed to accomplish the mission.

(4) Coordinate with all applicable DPW and installation agencies.

(5) Ensure contractors understand the requirements and procedures necessary to obtain a Dig Permit.

(6) Submit a FC Form 86-E to the DPW, O&MD, DPC for final coordination and approval. Call the DPC at 526-3089, if you have any questions. The DPW contractor designates its own coordinating action office for final coordination.

(7) Publish timely notices in the Mountaineer Newspaper for closures or outages. See FC Reg 420-19.

(8) Communicate with affected occupants and customers in case of disruptions, closures, or outages.

f. The DPW, O&MD contractor will:

(1) Receive a completed FC Form 86-E from the government construction representatives.

(2) Receive and record calls from contractors requesting utility locates. Receive copies of plans or sketches of the area and expected work start date from the contractor. Receive completed government utility locates; the DPC will color code utility maps; make copies for distribution; and file the master copy.

(3) Provide copies of ASI's locate form and map of dig area for the NEC, for timely marking of their owned utilities.

(4) Schedule on-site locating and marking.

(5) Assign a control number, reproduce copies of the approved request, and provide copies to the following:

(a) Contractor; agency performing work.

(b) Government representative.

(c) Locator team for DPW-owned utilities.

(d) Corps of Engineers (COE) construction representative, if the COE performed the inspection.

(e) Project file.

(f) Division engineer.

(6) File the approved original copy of the FCDP.

(7) The locator team for DPW-owned utilities will upon notification, schedule, attempt to locate, and mark by color code, all government utilities which are known to be at the excavation site. The DPW, O&M Contractor is not responsible for locating government-owned utilities for engineering survey data collection requests. Pick-up FC Form 86-E with plans and sketches of the excavation area from the Dig Permit Control Office (DPCO). Annotate applicable blocks on FC Form 86-E. Deliver the completed package to the DPCO for further processing.

g. The contractor (person or company) performing ground penetrating work will:

(1) Initiate a Dig Permit through the DPCO and keep the permit on site for the duration of the work. See Appendix B.

(2) Contact the DPCO a minimum of 10 working days, prior to the work start date, to schedule locating and marking government-owned utilities. Provide the DPC with plans or sketches of excavation areas and work start date. Advise the project manager or construction inspector of these actions.

(3) Contact applicable commercial utilities agencies listed on FC Form 86-E, Page 1 for commercial utilities clearance and obtain signatures on the form or other evidence of clearance.

(4) Sign FC Form 86-E, Page 2 after completion of the commercial/government-owned utility locates.

(5) Maintain a copy of the final approved FC Form 86-E for retention at the work site.

(6) Obtain subsequent clearance through the project manager or construction inspector, as necessary.

**Chapter 3**
**Facilities Engineering Dig Permits**

a. The FC Form 86-E constitutes a single coordination, review, and approval document for any work on the installation requiring ground penetrations. All FCDP's will include a map or sketch of the area considered for government utility locates.

b. All utility locates will be accomplished in a timely manner. Turnaround time for government staff utility locates should be within five (5) working days. In an emergency situation, response time for all utility locates will be completed within two (2) hours. Turnaround times may increase based on availability of resources.

c. Locates for government utilities will be scheduled through the DPCO. Changes in timelines will be established between the DPCO and the customer. When necessary, the DPCO will contact the Contracting Officer Representative (COR) for any Dig Permit extensions. The COR will determine the requirements necessary for an extension.

d. The Dig Permit is considered active for 30 days or less as requested. A 30-day Dig Permit time will start on the day the DPCO signs and notifies the customer. The marking of underground facilities will be considered valid as long as the markings are clearly visible, but not more than 30 calendar days. This is not valid if new facilities are added to the dig area after completion of the locate. Exceptions are approved by the DPCO after locator's review.

e. If excavation work is not completed within the 30 days allowed on the Dig Permit, a new permit must be applied for prior to continuance of work. Extensions are an exception to policy and will not be approved if there are communication lines in the dig area.

f. Verification of information pertaining to Dig Permits is completed prior to locate. Customers must read and sign the statement on FC Form 86-E, Page 2.

g. The DPCO will notify requester of approved Dig Permits.

h. It is the responsibility of the excavator to maintain adequate and accurate information at the job site.

i. Procedures for co-signs to a Dig Permit will be handled on a case by case basis and approved by the DPCO. Dig Permits will only be approved during the first 10 days of an active permit and will be limited to two (2) per Dig Permit.

**Chapter 4**
**Emergency Processing Procedures**

a. In emergency situations; such as ruptures or leakage of pipelines, explosions, fires, or similar instances where immediate action is necessary and advance processing of FC Form 86-E is impractical, the project manager will contact the DPCO.

b. The following are procedures performed by the project manager:

(1) In electrical or gas damage, call 911. Take precautions to avoid further damage to underground facilities and notify the government COR as soon as possible of location and extent of damage. The government COR will notify the DPW, O&MD Contractor for emergency repair.

(2) If the excavator finds it necessary to dig without locates, the excavator will take reasonable precautions to avoid damage to underground facilities.

(3) Prepare a FC Form 86-E within the first business day following the emergency. Include the following:

(a) Describe the nature of the emergency situation.

(b) Action taken by the contractor.

(c) The agency performing the work.

(d) The in-house or DPW contractor support provided for the emergency situation.

(4) Turn-in the FC Form 86-E into the DPCO for further processing.

**Chapter 5**
**Extended Permit Procedures**

a. Projects longer than the 30-day routine Dig Permit will request an extension during the approval stages of the FCDP.

b. Requests for an extended Dig Permit are the same as a routine Dig Permit.

c. Extension requests must be submitted before the expiration of the original Dig Permit. Requestors will notify the DPCO of the changes needed for the construction timeline.

d. During the extension, requestors are still responsible for maintaining the utility markings.

e. Only the DPCO can approve an extension.

Fort Carson Dig Permit

NEC
Network Enterprise Center

O&MD
Operations & Maintenance Division

PCMS
Pinon Canyon Maneuver Site

**Section II**
**Terms**

**Co-Sign -** Sharing of an approved and active dig permit by more than one excavating company. A request for a co-sign Dig Permit must follow the policies and procedures of the DPW, Base Operations and Maintenance Contractor's Dig Permit Office.

**Government representative -** A designated individual charged with the responsibility for the complete and timely initiation and coordination of a FC Form 86-E for a specific work project.

**DPW contractor -** An agency awarded a contract to perform certain DPW, non-governmental functions.

**Fort Carson Installation -** The boundary fence, easements and all real estate inside the fence, which includes the downrange area and the rail line to Kelker Junction.

**Pinon Canyon Maneuver Site (PCMS) -** The boundary fence, easements, and all real estate within the fence, including downrange and the rail line to the derail on the west side of Colorado State Highway 350.

**In-house -** The DPW, O&MD work force; government employees.

**Person -** Any individual, partnership, association, corporation, joint venture, contractor, in-house work force, troop unit, or representative of same.

**Section III**
**Special Abbreviations and Terms**

This section contains no entries.

**FACILITIES ENGINEERING DIG PERMIT REQUEST**

*(DPW is the proponent; the approving authority is FC Reg 420-20)*

DIG PERMIT NUMBER:

1. CLEARANCE IS REQUESTED TO PROCEED WITH WORK AT: _____

INVOLVING EXCAVATION, UTILITY, OR OTHER DISTURBANCES PER ATTACHED SKETCH.

| RECEIVED DATE: | PROJECT NO: | CONTRACTOR: |
|---|---|---|

2. TYPE OF FACILITY WORK INVOLVED - EXPLAN THE EXACT LOCATION AND PROPOSED WORK:

3. INSTRUCTIONS: This work clearance request is used for any work (contract or in-house) that may disrupt vehicular, rail, or air traffic flow, utility services, protection provided by fire and intrusion alarm systems or routine activities of the installation. This form is used to coordinate the required work with key installation activities and keep customer inconvenience to a minimum. It is also used to identify potentially hazardous work conditions in an attempt to prevent accidents. The work clearance request is processed just prior to the start of work. If delays are encountered and the conditions at the job site change (or may have changed) this work clearance must be reprocessed. If you have any questions, please call the Dig Permit Coordinator at 526-3089 or the Utility Locator at 524-0892.

| 4. SIGNATURE OF REQUESTING OFFICIAL: | 5. PHONE: |
|---|---|
| 6. DATE DIG PERMIT REQUIRED: | 7. DATE DIG PERMIT TERMINATED: |

| **ORGANIZATION** | **TICKET NUMBER** | **REVIEWER'S NAME & DATE** |
|---|---|---|
| 8. UNCC 1-800-922-1987 | | |
| 9. CITY OF FOUNTAIN WATER 382-5604 | | |
| 10. COMMUNICATIONS (HELP DESK) 526-5232 | | |
| 11. ENVIRONMENTAL COMPLIANCE 526-1682 | | |
| 12. BARRACK PHONE (SPRINT) 579-1000 | | |
| **13. GOVERNMENT UTILITIES** | **REMARKS AND INITIALS** | **REVIEWER'S NAME & DATE** |
| a. ELECTRICAL DISTRIBUTION | | |
| b. GAS DISTRIBUTION | | |
| c. CATHODIC PROTECTION | | |

| e. IRRIGATION SYSTEMS | | |
| f. SEWER LINES | | |
| g. STORM DRAIN SYSTEM | | |
| h. STEAM DISTRIBUTION | | |
| i. CHILLED WATER | | |
| j. COMPUTER/TRAFFIC | | |
| k. OTHER | | |

| 14. ROAD CLOSURE; IF NEEDED, PLEASE COMPLETE FC FORM 420-E (FORT CARSON UTILITY OUTAGE/CONNECTION REQUEST) | |
|---|---|
| a. MILITARY POLICE | |
| b. MEDDAC AMBULANCE 526-7112 | |
| c. FIRE PREVENTION 526-0651 | |
| 15. RANGE CONTROL 526-5597 | |
| 16. DPW TRAFFIC CONTROL 526-9267 | |
| 17. POST AGRONOMIST 526-1666/1696 | |

CONTRACT PRIOR TO:

1. ANY PROJECT THAT REQUIRES THE PLANTING OR DIGGING UP OF TREES AND BUSHES.
2. ANY PROJECT BEING DONE DOWNRANGE.
3. ANY PROJECT REQUIRING GROUND DISTURBANCE OR GREATER THAN ONE (1) ACRE.

18. REMARKS: THIS SECTION MUST DESCRIBE SPECIFIC PRECAUTIONARY MEASURES TO BE TAKEN BEFORE AND DURING WORK. SPECIFIC COMMENTS CONCERNING THE APPROVED METHOD OF EXCAVATION, HAND, OR POWERED EQUIPMENT SHOULD BE INCLUDED. NOTE: BORING: ALL UTILITIES MUST BE EXPOSED BEFORE CROSSING.

19. TROOP CONSTRUCTION:

**IMPORTANT - READ BEFORE SIGNING**

The undersigned understands that the Fort Carson Base Operations and Maintenance contract locators will attempt to locate the underground utility lines by using electronic detectors, maps, and other available information, but that all such methods may be inaccurate. Therefore, it is expressly understood and agreed between the undersigned and Fort Carson that NO GUARANTEES OR WARRANTIES, EXPRESSED OR IMPLIED, ARE MADE BY FORT CARSON as to the accuracy of any information furnish. Depth of bury, when provided, is never guaranteed. Twenty four inches either side of the stake, paint marks, or flag is considered a correct horizontal location for government owned utilities. When utilities cannot be electronically located, their approximate location will be drawn on the attached Underground Utility Location Map (Form.4.34.003). All identified utilities must be exposed before crossing or paralleling within three feet of the existing utility to determine bury depth. It is the responsibility of the undersigned and/or excavating company to pot hole or hand dig these identified utilities. All damages to any utilities by any person must be reported immediately so an investigation can be made to determine the cause of damage and arrangements made for necessary repairs. WHEN THE GOVERNMENT INVESTIGATOR DETERMINES THAT THE EXCAVATING COMPANY WAS AT FAULT AND DISREGARDED THE ABOVE MENTIONED INSTRUCTIONS, THE DIG PERMIT WILL BE TERMINATED. Locates are good for 30 days, unless extended by the government, and all utilities will be marked once, then it is the contractors responsibility to maintain the marks.

# Hydrant Use Application

**Organization:** _____

**Mailing Address:** _____

**Office Phone:** _____ **Cell Phone:** _____

**Hydrant Number:** _____**Location:**_____

**Hydrant Meter #:** _____ **Beginning Meter Reading (gallons):** _____

**Scheduled Start Date:** _____ **Scheduled Finish Date:** _____

**____ Backflow Preventer Will Be Used ____ Shutoff Valve Will Be Used**

**Proposed Use of Hydrant Water:** _____

**Note!! Use only fire hydrant wrenches on the caps or operating nut. No pipe wrenches. Open hydrant valve all to way to establish flow and prevent possible valve damage. Turn hydrant valve completely off at the end of each work day to allow the hydrant to drain and prevent freezing. Contractor WILL be charged for any hydrant valve damage they cause. Call 719-491-2982 or email vincent.e.guthrie2.civ@mail.mil with your meter reading by the 15TH of each month.**

Call the Fort Carson Dig Permit Office at (719) 302-0157 to obtain a work clearance/dig permit if any digging or excavation will be done. **Fort Carson requires that a backflow preventer and shutoff valve be used at the connection point to the fire hydrant. The backflow prevention device must be inspected and tested annually by a certified cross-connection technician. The technician shall place a dated label or tag on the backflow preventer indicating compliance.** Hydrants may be used for essential purposes only. Essential uses include, but are not limited to, dust mitigation, compaction, and construction site water use. Do not allow water to pool or flow onto the pavement or into gutters/storm sewers. Repair any system breaks and leaks immediately. Submit application to:

**Fort Carson Directorate of Public Works**
Vince Guthrie, 719-491-2982, vincent.e.guthrie2.civ@mail.mil
Building 1219, Room 127, M-F 0730 – 1600 hours

_____ _____
**Name** **Date**

**For Office Use Only**

**Permit Issued: No (see attached explanation) ____ Yes ____**

**Based on the information provided, a permit is issued authorizing the use of the requested hydrant. Call 719-491-2982 with the final meter reading from the hydrant. Keep a copy of this permit near the hydrant location, in your water truck(s), and/or in your construction trailer.**

**This permit will expire _____ day of _____, 201____.**

**DPW approval by** _____

## CLEARANCE MATRIX FOR TYPICAL FORT CARSON UNDERGROUND UTILITIES

**All separations shown are the clear horizontal distance between two objects measured surface to surface (All dimensions are in feet)**

| TYPE OF UTILITY | Potable Water | Non-Potable Water | Wastewater | Storm Sewer | Gas Main | Gas Service | Primary Electric | Secondary Electric | Communication Lines |
|---|---|---|---|---|---|---|---|---|---|
| Potable Water | | 10 | 10 | 10 | 6 | 3 | 10 | 10 | 10 |
| Non-Potable Water | 10 | | 10 | 10 | 6 | 3 | 10 | 10 | 10 |
| Wastewater | 10 | 10 | | 5 | 6 | 3 | 10 | 5 | 5 |
| Storm Sewer | 10 | 10 | 5 | | 6 | 3 | 10 | 5 | 5 |
| Gas Main | 6 | 6 | 6 | 6 | | 3 | 6 | 6 | 6 |
| Gas Service | 3 | 3 | 3 | 3 | 3 | | 3 | 1 | 1 |
| Primary Electric | 10 | 10 | 10 | 10 | 6 | 3 | | 1 | 1 |
| Secondary Electric | 10 | 10 | 5 | 5 | 6 | 1 | 1 | | 1 |
| Communication Lines | 10 | 10 | 5 | 5 | 6 | 1 | 1 | 1 | |

## CLEARANCE MATRIX FOR TYPICAL FORT CARSON UNDERGROUND UTILITY CROSSINGS

**All separations shown are the clear vertical distance between two objects measured surface to surface (All dimensions are in feet)**

| TYPE OF UTILITY | Potable Water | Non-Potable Water | Wastewater | Storm Sewer | Gas Main | Gas Service | Primary Electric | Secondary Electric | Communication Lines |
|---|---|---|---|---|---|---|---|---|---|
| Potable Water | | 1.5 | 1.5 | 1.5 | 1 | 1 | 1 | 1 | 1 |
| Non-Potable Water | 1.5 | | 1.5 | 1.5 | 1 | 1 | 1 | 1 | 1 |
| Wastewater | 1.5 | 1.5 | | 1.5 | 1 | 1 | 1 | 1 | 1 |
| Storm Sewer | 1.5 | 1.5 | 1.5 | | 1 | 1 | 1 | 1 | 1 |
| Gas Main | 1 | 1 | 1 | 1 | | 1 | 1 | 1 | 1 |
| Gas Service | 1 | 1 | 1 | 1 | 1 | | 1 | 1 | 1 |
| Primary Electric | 1 | 1 | 1 | 1 | 1 | 1 | | 1 | 1 |
| Secondary Electric | 1 | 1 | 1 | 1 | 1 | 1 | 1 | | 1 |
| Communication Lines | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | |

**Any deviations from the above clearances must be approved by the DPW, Operations and Maintenance Division**

**** Note: A potable water service line (Less than 3-inch Diameter) may be placed in a common trench with non-potable water/sewer building service under the following condition.**

**"The water service must be placed on a solid shelf excavated at one side of the common trench a minimum 1-foot over and above the top of the sewer pipe or non-potable water pipe plus 1-foot lateral separation."**

# ARMY ANTITERRORISM

# iWATCH Army Training for Contractors
# "See Something -- Say Something"

Unclassified

# Training Objective

- Contractors and all associated subcontractors performing work on Army contracts must receive this training on the local iWATCH Army program.
- The objective of this training is to inform employees of the types of suspicious activity or behavior to watch for and instruct employees to report suspicious activity or behavior to the Contract Officer Representative (COR), military police, or local law enforcement.
- Training should be completed within 30 calendar days of contract award and within 5 calendar days of new employees' commencing performance on active contracts (in the case of personnel changes).
- The results of the training shall be reported to the COR.

FCREG

# Training Topics

- Origin of iWATCH Army
- iWATCH Army Public Service Announcement (PSA)
- Indicators of Suspicious Activity or Behavior
- “See Something Say Something”
  - What to Report
  - How to Report
- Source for Other Important Information
- Local Point of Contact

FCREG

# Origin of iWATCH Army

- iWATCH Army is a nation-wide modern version of neighborhood watch designed to encourage and enable members of the Army community to help protect their community by identifying and reporting suspicious activity or behavior that may be associated with terrorist activities.
- The Passive element of iWATCH Army is individual situational awareness of the surroundings.
- The Active element of iWATCH Army involves individuals taking action to report suspicious activity or behavior to military police or local law enforcement for investigation.

Origin: Headquarters, Department of the Army, ALARACT Message 110/2010, Army Implementation of iWATCH (Terrorist Watch Program), 15 April 2010

FCREG

# IWATCH Army PSA

Place cursor inside black screen area. Control/play will appear at the bottom of the screen. Click ▶ (Play/Pause) to view the video.

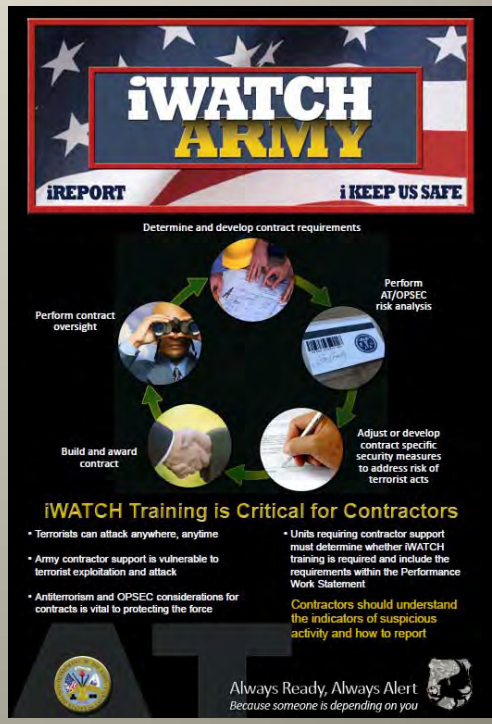
# Indicators of Suspicious Activity or Behavior (What to Report)

- Individuals drawing pictures or taking notes in an area not normally of interest to a tourist or showing unusual interest in or photographing security cameras, guard locations, or watching security reaction drills and procedures

- Multiple sightings of the same suspicious person, vehicle, or activity, separated by time, distance, or direction

- Individuals who stay at bus or train stops for extended periods while buses and trains come and go

- Individuals who order food at a restaurant and leave before the food arrives or who order without eating



# Indicators of Suspicious Activity or Behavior (What to Report)

- Joggers who stand and stretch for an inordinate amount of time

- Individuals sitting in a parked car for an extended period of time

- Individuals who don't fit into the surrounding environment because they are wearing improper attire for the location or season

- Individuals who exhibit suspicious behavior, such as staring or quickly looking away from individuals or vehicles as they enter or leave facilities or parking area

- People asking questions about security forces, security measures, or sensitive information

FCREG

# Indicators of Suspicious Activity or Behavior (What to Report)

- Briefcase, backpack, suitcase, or package left unattended
- Vehicle parked in NO PARKING ZONES in front of an important building
- People in restricted areas where they are not supposed to be
- Chemical smells or fumes that worry you
- People purchasing supplies or equipment that can be used to make bombs
- People purchasing weapons or uniforms without proper credentials

FCREG

# "See Something Say Something"

**Where to Report:**

- Military Police
- Local law enforcement
- Security forces
- Chain of Command
- Army Counterintelligence
- Contracting Officer Representative

eGUARDIAN

**How to Report:**

- Date and time activity occurred
- Where activity occurred
- Physical descriptions of the people involved
- Description of the vehicle(s) involved
- What type of activity
- Describe what you saw or heard
- Provide pictures if you took any

# Source for Other Information

**Examples of Information:**

- Antiterrorism Awareness Training
- Individual Protective Measures
- Individual Awareness Tips
- Insider Threats
- Active Shooter
- Cyber Threats
- Risks Associated with Social Media

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Project Scheduler Qualifications; G, RO

Preliminary Project Schedule; G, RO

Initial Project Schedule; G, RO

Periodic Schedule Update; G, RO

1.3 PROJECT SCHEDULER QUALIFICATIONS

Designate an authorized representative to be responsible for the preparation of the schedule and all required updating and production of reports. The authorized representative must have a minimum of 2-years experience scheduling construction projects similar in size and nature to this project with scheduling software that meets the requirements of this specification. Representative must have a comprehensive knowledge of CPM scheduling principles and application.

## PART 2 PRODUCTS

### 2.1 SOFTWARE

The scheduling software utilized to produce and update the schedules required herein must be capable of meeting all requirements of this specification.

#### 2.1.1 Government Default Software

The Government default software is Primavera P6.

#### 2.1.2 Contractor Software

Scheduling software used by the contractor must be commercially available from the software vendor for purchase with vendor software support agreements available. The software routine used to create the required sdef file must be created and supported by the software manufacturer.

##### 2.1.2.1 Primavera

If Primavera P6 is selected for use, provide the "xer" export file in a version of P6 importable by the Government system.

##### 2.1.2.2 Other Than Primavera

Use of software other than Primavera P6 must be approved by the Contracting Officer. If a different software system is approved, the Contracting Officer may require the Contractor to provide for the Government's use up to two licenses, two computers, and training for two Government employees in the use of the software. These computers will be stand-alone and not connected to Government network. Computers and licenses will be returned at project completion.

## PART 3 EXECUTION

### 3.1 GENERAL REQUIREMENTS

Prepare for approval a Project Schedule, as specified herein, pursuant to FAR Clause 52.236-15 Schedules for Construction Contracts. Show in the schedule the proposed sequence to perform the work and dates contemplated for starting and completing all schedule activities. The scheduling of the entire project is required. The scheduling of construction is the responsibility of the Contractor. Contractor management personnel must actively participate in its development. Subcontractors and suppliers working on the project must also contribute in developing and maintaining an accurate Project Schedule. Provide a schedule that is a forward planning as well as a project monitoring tool. Use the Critical Path Method (CPM) of network calculation to generate all Project Schedules. Prepare each Project Schedule using the Precedence Diagram Method (PDM).

### 3.2 BASIS FOR PAYMENT AND COST LOADING

The schedule is the basis for determining contract earnings during each update period and therefore the amount of each progress payment. The aggregate value of all activities coded to a contract CLIN must equal the value of the CLIN.

3.2.1 Activity Cost Loading

Activity cost loading must be reasonable and without front-end loading. Provide additional documentation to demonstrate reasonableness if requested by the Contracting Officer.

3.2.2 Withholdings / Payment Rejection

Failure to meet the requirements of this specification may result in the disapproval of the preliminary, initial or periodic schedule updates and subsequent rejection of payment requests until compliance is met.

In the event that the Contracting Officer directs schedule revisions and those revisions have not been included in subsequent Project Schedule revisions or updates, the Contracting Officer may withhold 10 percent of pay request amount from each payment period until such revisions to the project schedule have been made.

3.3 PROJECT SCHEDULE DETAILED REQUIREMENTS

3.3.1 Level of Detail Required

Develop the Project Schedule to the appropriate level of detail to address major milestones and to allow for satisfactory project planning and execution. Failure to develop the Project Schedule to an appropriate level of detail will result in its disapproval. The Contracting Officer will consider, but is not limited to, the following characteristics and requirements to determine appropriate level of detail:

3.3.2 Activity Durations

Reasonable activity durations are those that allow the progress of ongoing activities to be accurately determined between update periods. Less than 2 percent of all non-procurement activities may have Original Durations (OD) greater than 20 work days or 30 calendar days.

3.3.3 Procurement Activities

Include activities associated with the critical submittals and their approvals, procurement, fabrication, and delivery of long lead materials, equipment, fabricated assemblies, and supplies. Long lead procurement activities are those with an anticipated procurement sequence of over 90 calendar days.

3.3.4 Mandatory Tasks

Include the following activities/tasks in the initial project schedule and all updates.

a. Submission, review and acceptance of SD-01 Preconstruction Submittals (individual activity for each).

b. Submission, review and acceptance of features require design completion

c. Submission of mechanical/electrical/information systems layout drawings.

d. Long procurement activities

e. Submission and approval of O & M manuals.

f. Submission and approval of as-built drawings.

g. Submission and approval of DD1354 data and installed equipment lists.

h. Submission and approval of testing and air balance (TAB).

i. Submission of TAB specialist design review report.

j. Submission and approval of fire protection specialist.

k. Submission and approval of Building Commissioning Plan, test data, and reports: Develop the schedule logic associated with testing and commissioning of mechanical systems to a level of detail consistent with the contract commissioning requirements. All tasks associated with all building testing and commissioning will be completed prior to submission of building commissioning report and subsequent contract completion.

l. Air and water balancing.

m. Building commissioning - Functional Performance Testing.

n. Controls testing plan submission.

o. Controls testing.

p. Performance Verification testing.

q. Other systems testing, if required.

r. Contractor's pre-final inspection.

s. Correction of punch list from Contractor's pre-final inspection.

t. Government's pre-final inspection.

u. Correction of punch list from Government's pre-final inspection.

v. Final inspection.

3.3.5 Government Activities

Show Government and other agency activities that could impact progress. These activities include, but are not limited to: approvals, environmental permit approvals by State regulators, inspections, utility tie-in, Government Furnished Equipment (GFE) and Notice to Proceed (NTP) for phasing requirements.

3.3.6 Standard Activity Coding Dictionary

Use the activity coding structure defined in the Standard Data Exchange Format (SDEF) in ER 1-1-11. This exact structure is mandatory. Develop and assign all Activity Codes to activities as detailed herein. A template SDEF compatible schedule backup file is available on the web site: http://rms.usace.army.mil.

The SDEF format is as follows:

| Field | Activity Code | Length | Description |
|---|---|---|---|
| 1 | WRKP | 3 | Workers per day |
| 2 | RESP | 4 | Responsible party |
| 3 | AREA | 4 | Area of work |
| 4 | MODF | 6 | Modification Number |
| 5 | BIDI | 6 | Bid Item (CLIN) |
| 6 | PHAS | 2 | Phase of work |
| 7 | CATW | 1 | Category of work |
| 8 | FOW | 20 | Feature of work* |

*Some systems require that FEATURE OF WORK values be placed in several activity code fields. The notation shown is for Primavera P6. Refer to the specific software guidelines with respect to the FEATURE OF WORK field requirements.

3.3.6.1 Workers Per Day (WRKP)

Assign Workers per Day for all field construction or direct work activities, unless directed otherwise by the Contracting Officer. Workers per day is based on the average number of workers expected each day to perform a task for the duration of that activity.

3.3.6.2 Responsible Party Coding (RESP)

Assign responsibility code for all activities to the Prime Contractor, Subcontractor(s) or Government agency(ies) responsible for performing the activity.

a. Activities coded with a Government Responsibility code include, but are not limited to: Government approvals, Government design reviews, environmental permit approvals by State regulators, Government Furnished Property/Equipment (GFP) and Notice to Proceed (NTP) for phasing requirements.

b. Activities cannot have more than one Responsibility Code. Examples of acceptable activity code values are: DOR (for the designer of record); ELEC (for the electrical subcontractor); MECH (for the mechanical subcontractor); and GOVT (for USACE).

3.3.6.3 Area of Work Coding (AREA)

Assign Work Area code to activities based upon the work area in which the activity occurs. Define work areas based on resource constraints or space constraints that would preclude a resource, such as a particular trade or craft work crew from working in more than one work area at a time due to restraints on resources or space. Examples of Work Area Coding include different areas within a floor of a building, different floors within a building, and different buildings within a complex of buildings.

Activities cannot have more than one Work Area Code.

Not all activities are required to be Work Area coded. A lack of Work Area coding indicates the activity is not resource or space constrained.

3.3.6.4 Modification Number (MODF)

Assign a Modification Number Code to any activity or sequence of activities added to the schedule as a result of a Contract Modification, when approved by Contracting Officer. Key all Code values to the Government's modification numbering system. An activity can have only one Modification Number Code.

3.3.6.5 Bid Item Coding (BIDI)

Assign a Bid Item Code to all activities using the Contract Line Item Schedule (CLIN) to which the activity belongs, even when an activity is not cost loaded. An activity can have only one BIDI Code.

3.3.6.6 Phase of Work Coding (PHAS)

Assign Phase of Work Code to all activities. Examples of phase of work are procurement phase and construction phase. Each activity can have only one Phase of Work code.

a. Code proposed fast track design and construction phases proposed to allow filtering and organizing the schedule by fast track design and construction packages.

b. If the contract specifies phasing with separately defined performance periods, identify a Phase Code to allow filtering and organizing the schedule accordingly.

3.3.6.7 Category of Work Coding (CATW)

Assign a Category of Work Code to all activities. Category of Work Codes include, but are not limited to construction submittal, procurement, fabrication, weather sensitive installation, non-weather sensitive installation, start-up, and testing activities. Each activity can have no more than one Category of Work Code.

3.3.6.8 Feature of Work Coding (FOW)

Assign a Feature of Work Code to appropriate activities based on the Definable Feature of Work to which the activity belongs based on the approved QC plan.

Definable Feature of Work is defined in Section 01 45 00.00 10 QUALITY CONTROL. An activity can have only one Feature of Work Code.

3.3.7 Contract Milestones and Constraints

Milestone activities are to be used for significant project events including, but not limited to, project phasing, project start and end activities, or interim completion dates. The use of artificial float constraints such as "zero free float" or "zero total float" are prohibited.

Mandatory constraints that ignore or effect network logic are prohibited.

No constrained dates are allowed in the schedule other than those specified herein. Submit additional constraints to the Contracting Officer for approval on a case by case basis.

3.3.7.1 Project Start Date Milestone and Constraint

The first activity in the project schedule must be a start milestone titled "NTP Acknowledged," which must have a "Start On" constraint date equal to the date that the NTP is acknowledged.

3.3.7.2 End Project Finish Milestone and Constraint

The last activity in the schedule must be a finish milestone titled "End Project."

Constrain the project schedule to the Contract Completion Date in such a way that if the schedule calculates an early finish, then the float calculation for "End Project" milestone reflects positive float on the longest path. If the project schedule calculates a late finish, then the "End Project" milestone float calculation reflects negative float on the longest path. The Government is under no obligation to accelerate Government activities to support a Contractor's early completion.

3.3.7.3 Interim Completion Dates and Constraints

Constrain contractually specified interim completion dates to show negative float when the calculated late finish date of the last activity in that phase is later than the specified interim completion date.

3.3.7.3.1 Start Phase

Use a start milestone as the first activity for a project phase. Call the start milestone "Start Phase X" where "X" refers to the phase of work.

3.3.7.3.2 End Phase

Use a finish milestone as the last activity for a project phase. Call the finish milestone "End Phase X" where "X" refers to the phase of work.

3.3.8 Calendars

Schedule activities on a Calendar to which the activity logically belongs. Develop calendars to accommodate any contract defined work period such as a 7-day calendar for Government Acceptance activities, concrete cure times, etc. Develop the default Calendar to match the physical work plan with non-work periods identified including weekends and holidays. Develop sSeasonal Calendar(s) and assign to seasonally affected activities as applicable.

If an activity is weather sensitive it should be assigned to a calendar showing non-work days on a monthly basis, with the non-work days selected at random across the weeks of the calendar, using the anticipated adverse weather delay work days provided in the Special Contract Requirements. Assign non-work days over a seven-day week as weather records are compiled on seven-day weeks, which may cause some of the weather related non-work days to fall on weekends.

3.3.9 Open Ended Logic

Only two open ended activities are allowed: the first activity "NTP Acknowledged" may have no predecessor logic, and the last activity -"End Project" may have no successor logic.

Predecessor open ended logic may be allowed in a time impact analyses upon the Contracting Officer's approval.

3.3.10 Default Progress Data Disallowed

Actual Start and Finish dates must not automatically update with default mechanisms included in the scheduling software. Updating of the percent complete and the remaining duration of any activity must be independent functions. Disable program features that calculate one of these parameters from the other. Activity Actual Start (AS) and Actual Finish (AF) dates assigned during the updating process must match those dates provided in the Contractor Quality Control Reports. Failure to document the AS and AF dates in the Daily Quality Control report will result in disapproval of the Contractor's schedule.

3.3.11 Out-of-Sequence Progress

Activities that have progressed before all preceding logic has been satisfied (Out-of-Sequence Progress) will be allowed only on a case-by-case basis subject to approval by the Contracting Officer. Propose logic corrections to eliminate out of sequence progress or justify not changing the sequencing for approval prior to submitting an updated project schedule. Address out of sequence progress or logic changes in the Narrative Report and in the periodic schedule update meetings.

3.3.12 Added and Deleted Activities

Do not delete activities from the project schedule or add new activities to the schedule without approval from the Contracting Officer. Activity ID and description changes are considered new activities and cannot be changed without Contracting Officer approval.

3.3.13 Original Durations

Activity Original Durations (OD) must be reasonable to perform the work item. OD changes are prohibited unless justification is provided and approved by the Contracting Officer.

3.3.14 Leads, Lags, and Start to Finish Relationships

Lags must be reasonable as determined by the Government and not used in place of realistic original durations, must not be in place to artificially absorb float, or to replace proper schedule logic.

a. Leads (negative lags) are prohibited.

b. Start to Finish (SF) relationships are prohibited.

3.3.15 Retained Logic

Schedule calculations must retain the logic between predecessors and successors ("retained logic" mode) even when the successor activity(s) starts and the predecessor activity(s) has not finished (out-of-sequence

progress). Software features that in effect sever the tie between predecessor and successor activities when the successor has started and the predecessor logic is not satisfied ("progress override") are not be allowed.

3.3.16 Percent Complete

Update the percent complete for each activity started, based on the realistic assessment of earned value. Activities which are complete but for remaining minor punch list work and which do not restrain the initiation of successor activities may be declared 100 percent complete to allow for proper schedule management.

3.3.17 Remaining Duration

Update the remaining duration for each activity based on the number of estimated work days it will take to complete the activity. Remaining duration may not mathematically correlate with percentage found under paragraph entitled Percent Complete.

3.3.18 Cost Loading of Closeout Activities

Cost load the "Correction of punch list from Government pre-final inspection" activity(ies) not less than 1 percent of the present contract value. Activity(ies) may be declared 100 percent complete upon the Government's verification of completion and correction of all punch list work identified during Government pre-final inspection(s).

3.3.18.1 As-Built Drawings

If there is no separate contract line item (CLIN) for as-built drawings, cost load the "Submission and approval of as-built drawings" activity not less than $35,000 or 1 percent of the present contract value, whichever is greater, up to $200,000. Activity will be declared 100 percent complete upon the Government's approval.

3.3.18.2 O & M Manuals

Cost load the "Submission and approval of O & M manuals" activity not less than $20,000. Activity will be declared 100 percent complete upon the Government's approval of all O & M manuals.

3.3.19 Early Completion Schedule and the Right to Finish Early

An Early Completion Schedule is an Initial Project Schedule (IPS) that indicates all scope of the required contract work will be completed before the contractually required completion date.

a. No IPS indicating an Early Completion will be accepted without being fully resource-loaded (including crew sizes and manhours) and the Government agreeing that the schedule is reasonable and achievable.

b. The Government is under no obligation to accelerate work items it is responsible for to ensure that the early completion is met nor is it responsible to modify incremental funding (if applicable) for the project to meet the contractor's accelerated work.

## 3.4 PROJECT SCHEDULE SUBMISSIONS

Provide the submissions as described below. The files, reports, and network diagrams required for each submission are contained in paragraph SUBMISSION REQUIREMENTS. If the Contractor fails or refuses to furnish the information and schedule updates as set forth herein, then the Contractor will be deemed not to have provided an estimate upon which a progress payment can be made.

Review comments made by the Government on the schedule(s) do not relieve the Contractor from compliance with requirements of the Contract Documents.

### 3.4.1 Preliminary Project Schedule Submission

Within 15 calendar days after the NTP is acknowledged submit the Preliminary Project Schedule defining the planned operations detailed for the first 90 calendar days for approval. The approved Preliminary Project Schedule will be used for payment purposes not to exceed 90 calendar days after NTP. Completely cost load the Preliminary Project Schedule to balance the contract award CLINS shown on the Price Schedule. The Preliminary Project Schedule may be summary in nature for the remaining performance period. It must be early start and late finish constrained and logically tied as specified. The Preliminary Project Schedule forms the basis for the Initial Project Schedule specified herein and must include all of the required plan and program preparations, submissions and approvals identified in the contract (for example, Quality Control Plan, Safety Plan, and Environmental Protection Plan) as well as design activities, planned submissions of all early design packages, permitting activities, design review conference activities, and other non-construction activities intended to occur within the first 90 calendar days. Government acceptance of the associated design package(s) and all other specified Program and Plan approvals must occur prior to any planned construction activities. Activity code any activities that are summary in nature after the first 90 calendar days with Bid Item (CLIN) code (BIDI), Responsibility Code (RESP) and Feature of Work code (FOW).

### 3.4.2 Initial Project Schedule Submission

Submit the Initial Project Schedule for approval within 42 calendar days after notice to proceed is issued. The schedule must demonstrate a reasonable and realistic sequence of activities which represent all work through the entire contract performance period. No payment will be made for work items not fully detailed in the Project Schedule.

### 3.4.3 Periodic Schedule Updates

Update the Project Schedule routinely at an interval approved by the Contracting Officer or designated representative. Provide a draft Periodic Schedule Update for review at the schedule update meetings as prescribed in the paragraph PERIODIC SCHEDULE UPDATE MEETINGS. These updates will enable the Government to assess Contractor's progress.

a. Update information including Actual Start Dates (AS), Actual Finish Dates (AF), Remaining Durations (RD), and Percent Complete is subject to the approval of the Government at the meeting.

b. AS and AF dates must match the date(s) reported on the Contractor's Quality Control Report for an activity start or finish.

## 3.5 SUBMISSION REQUIREMENTS

Submit the following items for the Preliminary Schedule, Initial Schedule, and every Periodic Schedule Update throughout the life of the project:

### 3.5.1 Submission

Submit the current project schedule, the narrative report and all required schedule reports electronically using the project submittal/transmittal process or by serialized letter. Each schedule must have a unique file name and use project specific settings.

### 3.5.2 Narrative Report

Provide a Narrative Report with each schedule submission. The Narrative Report is expected to communicate to the Government the thorough analysis of the schedule output and the plans to compensate for any problems, either current or potential, which are revealed through that analysis. Include the following information as minimum in the Narrative Report:

a. Identify and discuss the work scheduled to start in the next update period.

b. A description of activities along the two most critical paths where the total float is less than or equal to 20 work days.

c. A description of current and anticipated problem areas or delaying factors and their impact and an explanation of corrective actions taken or required to be taken.

d. Identify and explain why activities based on their calculated late dates should have either started or finished during the update period but did not.

e. Identify and discuss all schedule changes by activity ID and activity name including what specifically was changed and why the change was needed. Include at a minimum new and deleted activities, logic changes, duration changes, calendar changes, lag changes, resource changes, and actual start and finish date changes.

f. Identify and discuss out-of-sequence work.

### 3.5.3 Schedule Reports

The format, filtering, organizing and sorting for each schedule report will be as directed by the Contracting Officer or designated representative. Typically, reports contain Activity Numbers, Activity Description, Original Duration, Remaining Duration, Early Start Date, Early Finish Date, Late Start Date, Late Finish Date, Total Float, Actual Start Date, Actual Finish Date, and Percent Complete. Provide the reports electronically in .pdf format. The following reports are required for schedule submission reviews unless directed otherwise by the Contracting Officer.

#### 3.5.3.1 Activity Report

List of all activities sorted according to activity number.

3.5.3.2 Logic Report

List of detailed predecessor and successor activities for every activity in ascending order by activity number.

3.5.3.3 Total Float Report

A list of all incomplete activities sorted in ascending order of total float. List activities which have the same amount of total float in ascending order of Early Start Dates. Do not show completed activities on this report.

3.5.3.4 Earnings Report by CLIN

A compilation of the Total Earnings on the project from the NTP to the data date, which reflects the earnings of activities based on the agreements made in the schedule update meeting defined herein. Provided a complete schedule update has been furnished, this report serves as the basis of determining progress payments. Group activities by CLIN number and sort by activity number. Provide a total CLIN percent earned value, CLIN percent complete, and project percent complete. The printed report must contain the following for each activity: the Activity Number, Activity Description, Original Budgeted Amount, Earnings to Date, Earnings this period, Total Quantity, Quantity to Date, and Percent Complete (based on cost).

3.5.3.5 Schedule Log

Provide a Scheduling/Leveling Report generated from the current project schedule being submitted.

3.5.3.6 Critical Path

Provide an Adobe .pdf report showing the critical path.

3.5.4 Network Diagram

The Network Diagram is required for the Preliminary, Initial and Periodic Updates. Depict and display the order and interdependence of activities and the sequence in which the work is to be accomplished. The Contracting Officer will use, but is not limited to, the following conditions to review compliance with this paragraph:

3.5.4.1 Continuous Flow

Show a continuous flow from left to right with no arrows from right to left. Show the activity number, description, duration, and estimated earned value on the diagram.

3.5.4.2 Project Milestone Dates

Show dates on the diagram for start of project, any contract required interim completion dates, and contract completion dates.

3.5.4.3 Critical Path

Show all activities on the critical path. The critical path is defined as the longest path.

3.5.4.4 Banding

Organize activities using the WBS or as otherwise directed to assist in the understanding of the activity sequence. Typically, this flow will group activities by major elements of work, category of work, work area and/or responsibility.

3.5.4.5 Cash Flow / Schedule Variance Control (SVC) Diagram

With each schedule submission, provide a SVC diagram showing 1) Cash Flow S-Curves indicating planned project cost based on projected early and late activity finish dates, and 2) Earned Value to-date.

3.6 PERIODIC SCHEDULE UPDATE

3.6.1 Periodic Schedule Update Meetings

Conduct periodic schedule update meetings for the purpose of reviewing the proposed percent complete, Periodic Schedule Update, Narrative Report, Schedule Reports, and progress payment. Conduct meetings at least monthly and within five days of the proposed schedule data date. The Contractor may be requested to provide a computer with the scheduling software loaded and a projector which allows all meeting participants to view the proposed schedule during the meeting. The Contractor's authorized scheduler must organize, group, sort, filter, perform schedule revisions as needed and review functions as requested by the Contractor and/or Government. The meeting is a working interactive exchange which allows the Government and Contractor the opportunity to review the updated schedule on a real time and interactive basis. The meeting will last no longer than 8 hours. The Contractor's Project Manager and scheduler must attend the meeting with the authorized representative of the Contracting Officer. Superintendents, foremen and major subcontractors must attend the meeting as required to discuss the project schedule and work. Following the periodic schedule update meeting, make updates to the draft submission. Include only those items approved by the Government in the submission. Upon Government approval of the schedule submission, submit an invoice for payment.

3.6.2 Update Submission Following Progress Meeting

Submit the complete Periodic Schedule Update of the Project Schedule containing all approved progress, revisions, and adjustments, pursuant to paragraph SUBMISSION REQUIREMENTS not later than 4 work days after the periodic schedule update meeting.

3.7 WEEKLY PROGRESS MEETINGS

Conduct a weekly meeting with the Government (or as otherwise mutually agreed to) between the meetings described in paragraph entitled PERIODIC SCHEDULE UPDATE MEETINGS for the purpose of jointly reviewing the actual progress of the project as compared to the as planned progress and to review planned activities for the upcoming two weeks. Use the current approved schedule update for the purposes of this meeting and for the production and review of reports. At the weekly progress meeting, address the status of RFIs, RFPs and Submittals.

3.8 REQUESTS FOR TIME EXTENSIONS

Provide a justification of delay to the Contracting Officer in accordance

with the contract provisions and clauses for approval within 10 days of a delay occurring. Also prepare a time impact analysis for each Government request for proposal (RFP)/ All time impact analysis must be resource loaded and to the same level of detail as the schedule.

3.8.1 Justification of Delay

Provide a description of the event(s) that caused the delay and/or impact to the work. As part of the description, identify all schedule activities impacted. Show that the event that caused the delay/impact was the responsibility of the Government. Provide a time impact analysis that demonstrates the effects of the delay or impact on the project completion date or interim completion date(s). Evaluate multiple impacts chronologically; each with its own justification of delay. With multiple impacts consider any concurrency of delay. A time extension and the schedule fragnet becomes part of the project schedule and all future schedule updates upon approval by the Contracting Officer.

3.8.2 Time Impact Analysis (Prospective Analysis)

Prepare a time impact analysis for approval by the Contracting Officer based on industry standard AACE 52R-06. Utilize a copy of the last approved schedule prior to the first day of the impact or delay for the time impact analysis. If Contracting Officer determines the time frame between the last approved schedule and the first day of impact is too great, prepare an interim updated schedule to perform the time impact analysis. Unless approved by the Contracting Officer, no other changes may be incorporated into the schedule being used to justify the time impact.

3.8.3 Forensic Schedule Analysis (Retrospective Analysis)

Prepare an analysis for approval by the Contracting Officer based on industry standard AACE 29R-03.

3.8.4 Fragmentary Network (Fragnet)

Prepare a proposed fragnet for time impact analysis consisting of a sequence of new activities that are proposed to be added to the project schedule to demonstrate the influence of the delay or impact to the project's contractual dates. Clearly show how the proposed fragnet is to be tied into the project schedule including all predecessors and successors to the fragnet activities. The proposed fragnet must be approved by the Contracting Officer prior to incorporation into the project schedule.

3.8.5 Time Extension

The Contracting Officer must approve the Justification of Delay including the time impact analysis before a time extension will be granted. No time extension will be granted unless the delay consumes all available Project Float and extends the projected finish date ("End Project" milestone) beyond the Contract Completion Date. The time extension will be in calendar days.

Actual delays that are found to be caused by the Contractor's own actions, which result in a calculated schedule delay will not be a cause for an extension to the performance period, completion date, or any interim milestone date.

### 3.8.6 Impact to Early Completion Schedule

No extended overhead will be paid for delay prior to the original Contract Completion Date for an Early Completion IPS unless the Contractor actually performed work in accordance with that Early Completion Schedule. The Contractor must show that an early completion was achievable had it not been for the impact.

## 3.9 FAILURE TO ACHIEVE PROGRESS

Should the progress fall behind the approved project schedule for reasons other than those that are excusable within the terms of the contract, the Contracting Officer may require provision of a written recovery plan for approval. The plan must detail how progress will be made-up to include which activities will be accelerated by adding additional crews, longer work hours, extra work days, etc.

### 3.9.1 Artificially Improving Progress

Artificially improving progress by means such as, but not limited to, revising the schedule logic, modifying or adding constraints, shortening activity durations, or changing calendars in the project schedule is prohibited. Indicate assumptions made and the basis for any logic, constraint, duration and calendar changes used in the creation of the recovery plan. Any additional resources, manpower, or daily and weekly work hour changes proposed in the recovery plan must be evident at the work site and documented in the daily report along with the Schedule Narrative Report.

### 3.9.2 Failure to Perform

Failure to perform work and maintain progress in accordance with the supplemental recovery plan may result in an interim and final unsatisfactory performance rating and may result in corrective action directed by the Contracting Officer pursuant to FAR 52.236-15 Schedules for Construction Contracts, FAR 52.249-10 Default (Fixed-Price Construction), and other contract provisions.

### 3.9.3 Recovery Schedule

Should the Contracting Officer find it necessary, submit a recovery schedule pursuant to FAR 52.236-15 Schedules for Construction Contracts.

## 3.10 OWNERSHIP OF FLOAT

Except for the provision given in the paragraph IMPACT TO EARLY COMPLETION SCHEDULE, float available in the schedule, at any time, may not be considered for the exclusive use of either the Government or the Contractor including activity and/or project float. Activity float is the number of work days that an activity can be delayed without causing a delay to the "End Project" finish milestone. Project float (if applicable) is the number of work days between the projected early finish and the contract completion date milestone.

## 3.11 TRANSFER OF SCHEDULE DATA INTO RMS

Once the schedule is approved by the Government via submittal or serialized letter, upload the schedule data (SDEF) into the Resident

Management System - Contractor Module (RMS CM) unless directed otherwise by the Contracting Officer. The contractor will then create the invoice and complete the Prompt Payment certificate and submit to the Government. After this is complete, create the invoice, complete the Prompt Payment certificate and submit to the Government. This data is considered to be additional supporting data in a form and detail required by the Contracting Officer pursuant to FAR 52.232-5 Payments under Fixed-Price Construction Contracts and FAR 52.232-27 Prompt Payment for Construction Contracts.

## 3.12 PRIMAVERA P6 MANDATORY REQUIREMENTS

The following settings are mandatory and required in all schedule submissions to the Government, if Primavera P6 is used:

a. Activity Codes must be Project Level, not Global or EPS level.

b. Calendars must be Project Level, not Global or Resource level.

c. Activity Duration Types must be set to "Fixed Duration & Units".

d. Percent Complete Types must be set to "Physical".

e. Time Period Admin Preferences must remain the default "8.0 hr/day, 40 hr/week, 172 hr/month, 2000 hr/year". Set Calendar Work Hours/Day to 8.0 Hour days.

f. Set Schedule Option for defining Critical Activities to "Longest Path".

g. Set Schedule Option for defining progressed activities to "Retained Logic".

h. Set up cost loading using a single lump sum labor resource. The Price/Unit must be $1/hr, Default Units/Time must be "8h/d", and settings "Auto Compute Actuals" and "Calculate costs from units" selected.

i. Activity ID's must not exceed 10 characters.

j. Activity Names must have the most defining and detailed description within the first 30 characters.

SECTION 01 33 00

SUBMITTAL PROCEDURES
**08/18, OMH 08/2020**

PART 1 GENERAL

1.1 SUMMARY

1.1.1 Submittal Information

The Contractor is responsible for total management of their work including, but not limited to, approval, scheduling, control, certification of all submittals and compliance with all applicable Buy-American and Trade Agreement clauses. The submittal management system provided in these specifications is intended to be a complete system for the Contractor to use to control the quality of materials, equipment and workmanship provided by manufacturers, fabricators, suppliers and subcontractors. Review each submittal for contract compliance. **Compliance with all applicable Buy American and Trade Agreement Clauses is to be included in this review. The Contractor must provide the country of origin on ENG Form 4025 for each item submitted.** The Submittal Register (ENG Form 4288) will be utilized to log and monitor all submittal activities.

The Contracting Officer may request submittals, in addition to those specified, when deemed necessary to adequately describe the work covered in the respective sections. Each submittal is to be complete and in sufficient detail to allow ready determination of compliance with contract requirements.

Units of weights and measures used on all submittals are to be the same as those used in the contract drawings.

1.1.2 Project Type

The Contractor's Quality Control (CQC) System Manager is to check and approve all items before submittal and stamp, sign, and date indicating action taken. Clearly identify proposed deviations from the contract requirements. Include within submittals items such as: Contractor's, manufacturer's, or fabricator's drawings; descriptive literature including (but not limited to) catalog cuts, diagrams, operating charts or curves; test reports; test cylinders; samples; O&M manuals (including parts list); certifications; warranties; and other such required items.

1.1.3 Submission of Submittals

Schedule and provide submittals requiring Government approval, after notice to proceed (NTP). Provide ample lead time to ensure the submittal's processing by the Government and any lead time needed by the manufacturer upon ordering after approval. Dispose of samples not incorporated into the work in accordance with manufacturer's Safety Data Sheets (SDS) and in compliance with existing laws and regulations.

1.2 DEFINITIONS

1.2.1 Submittal Descriptions (SD)

Submittal requirements are specified in the technical sections. Examples and descriptions of submittals identified by the Submittal Description (SD) numbers and titles follow:

SD-01 Preconstruction Submittals

Submittals that are required prior to or at the start of construction (work) or the next major phase of the construction on a multiphase contract.

Preconstruction Submittals include schedules and a tabular list of locations, features, and other pertinent information regarding products, materials, equipment, or components to be used in the work.

The Government reserves the right to handle pre-construction submittals (listed below) as administrative submittals via a Serial Letter, as directed by the Project, Area or Resident Office. When directed by the Project, Area or Resident Office (as directed), submit administrative submittals for acceptance by the Government. Format for the Serial Letter will be as directed by the Project, Area or Resident Office.

Certificates Of Insurance

Surety Bonds

List Of Proposed Subcontractors

List Of Proposed Products

Baseline Network Analysis Schedule (NAS)

Submittal Register

Schedule Of Prices Or Earned Value Report

Accident Prevention Plan

Work Plan

Quality Control (QC) plan

Permits

Environmental Protection Plan

SD-02 Shop Drawings

Drawings, diagrams and schedules specifically prepared to illustrate some portion of the work.

Diagrams and instructions from a manufacturer or fabricator for use in producing the product and as aids to the Contractor for integrating the product or system into the project.

Drawings prepared by or for the Contractor to show how multiple systems and interdisciplinary work will be coordinated.

SD-03 Product Data

Catalog cuts, illustrations, schedules, diagrams, performance charts, instructions and brochures illustrating size, physical appearance and other characteristics of materials, systems or equipment for some portion of the work.

Samples of warranty language when the contract requires extended product warranties.

SD-04 Samples

Fabricated or unfabricated physical examples of materials, equipment or workmanship that illustrate functional and aesthetic characteristics of a material or product and establish standards by which the work can be judged.

Color samples from the manufacturer's standard line (or custom color samples if specified) to be used in selecting or approving colors for the project.

Field samples and mock-ups constructed on the project site establish standards ensuring work can be judged. Includes assemblies or portions of assemblies that are to be incorporated into the project and those that will be removed at conclusion of the work.

SD-05 Design Data

Design calculations, mix designs, analyses or other data pertaining to a part of work.

SD-06 Test Reports

Report signed by authorized official of testing laboratory that a material, product or system identical to the material, product or system to be provided has been tested in accord with specified requirements. Unless specified in another section, testing must have been within three years of date of contract award for the project.

Report that includes findings of a test required to be performed on an actual portion of the work or prototype prepared for the project before shipment to job site.

Report that includes finding of a test made at the job site or on sample taken from the job site, on portion of work during or after installation.

Investigation reports

Daily logs and checklists

Final acceptance test and operational test procedure

SD-07 Certificates

Statements printed on the manufacturer's letterhead and signed by responsible officials of manufacturer of product, system or material

attesting that the product, system, or material meets specification requirements. Must be dated after award of project contract and clearly name the project.

Document required of Contractor, or of a manufacturer, supplier, installer or Subcontractor through Contractor. The document purpose is to further promote the orderly progression of a portion of the work by documenting procedures, acceptability of methods, or personnel qualifications.

Confined space entry permits

Text of posted operating instructions

SD-08 Manufacturer's Instructions

Preprinted material describing installation of a product, system or material, including special notices and (SDS)concerning impedances, hazards and safety precautions.

SD-09 Manufacturer's Field Reports

Documentation of the testing and verification actions taken by manufacturer's representative at the job site, in the vicinity of the job site, or on a sample taken from the job site, on a portion of the work, during or after installation, to confirm compliance with manufacturer's standards or instructions. The documentation must be signed by an authorized official of a testing laboratory or agency and state the test results; and indicate whether the material, product, or system has passed or failed the test.

Factory test reports.

SD-10 Operation and Maintenance Data

Data provided by the manufacturer, or the system provider, including manufacturer's help and product line documentation, necessary to maintain and install equipment, for operating and maintenance use by facility personnel.

Data required by operating and maintenance personnel for the safe and efficient operation, maintenance and repair of the item.

Data incorporated in an operations and maintenance manual or control system.

SD-11 Closeout Submittals

Documentation to record compliance with technical or administrative requirements or to establish an administrative mechanism.

Submittals required for Guiding Principle Validation (GPV) or Third Party Certification (TPC).

Special requirements necessary to properly close out a construction contract. For example, Record Drawings and as-built drawings. Also, submittal requirements necessary to properly close out a major phase of construction on a multi-phase contract.

1.2.2 Approving Authority

Office or designated person authorized to approve the submittal.

1.2.3 Work

As used in this section, on-site and off-site construction required by contract documents, including labor necessary to produce submittals, construction, materials, products, equipment, and systems incorporated or to be incorporated in such construction. In exception, excludes work to produce SD-01 submittals.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having any designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with this section. When directed by the Government, the submittal register may be submitted via Section of 01 45 00.15 10 RESIDENTIAL MANAGMENT SYSTEM CONTRACTOR MODE (RMS-CM) in lieu of the copy attached to this section. SpecsIntact is the software system used by Government to generate the Submittal Register that is loaded into RMS-CM.

SD-01 Preconstruction Submittals

Submittal Register; G-RO

1.3.1 Action Codes

1.3.1.1 Contractor Action Codes

| DESIGN BID BUILD SUBMITTALS | | | |
|---|---|---|---|
| Submittal Classifications shown in UFGS Sections | Submittal Classification | Corresponding SpecsIntact Submittal Register Code which is populated in the SI Submittal Register. Software Limitations: (The software shows one character delineation in the SpecsIntact Submittal Register) | RMS – The following Submittal Classifications are populated in RMS when the SpecsIntact Submittal Data File is pulled into RMS) |
| G | Submittal requires Government Approval | G | GA |

| DESIGN BID BUILD SUBMITTALS | | | |
|---|---|---|---|
| BLANK | Submittal is For Information Only (FIO) | BLANK | FIO |

1.3.1.2 Government Reviewer Designations

Following the Submittal Classification designation "G", the following reviewer designations may be included:

RO - Resident Office
AO - Area Office
DO - District Office

Additional information will be provided at the pre-design and/or pre-construction conference.

Corps of Engineers, Omaha District Office for "DO" reviewer designations, submittals will be coordinated through:

Michael Hebert
U.S. Army Corps of Engineers
Omaha District
Attn: CENWO-CDS-T
1616 Capitol Ave
Omaha, NE 68102-4901
E-mail: CENWO.ConstructionSubmittal@usace.army.mil

1.4 SUBMITTAL CLASSIFICATION

1.4.1 Government Approved (G)

Government approval is required for extensions of design, critical materials, variations, equipment whose compatibility with the entire system must be checked, and other items as designated by the Government.

Within the terms of the Contract Clause SPECIFICATIONS AND DRAWINGS FOR CONSTRUCTION, submittals are considered to be "shop drawings."

1.4.2 For Information Only

Submittals not requiring Government approval will be for information only. Within the terms of the Contract Clause SPECIFICATIONS AND DRAWINGS FOR CONSTRUCTION, they are not considered to be "shop drawings."

1.4.3 Sustainability Reporting Submittals

Sustainability reporting submittals are as specified in Section 01 33 29 SUSTAINABILITY REPORTING.

Schedule submittals for these items throughout the course of construction as provided; do not wait until closeout.

## 1.5 PREPARATION

### 1.5.1 Transmittal Form

Use the ENG Form 4025 transmittal form for submitting both Government-approved and information-only submittals. Submit in accordance with the instructions on the reverse side of the form. These forms are included in the RMS CM software that the Contractor is required to use for this contract. Properly complete this form by filling out all the heading blank spaces and identifying each item submitted. If there are multiple Item numbers listed on a particular ENG Form 4025 submittal, combine all submitted items for review into a single Adobe file with bookmarks (for ease of review). Exercise special care to ensure proper listing of the specification paragraph and sheet number of the contract drawings pertinent to the data submitted for each item.

### 1.5.2 Submittal Format

#### 1.5.2.1 Format of SD-01 Preconstruction Submittals

When the submittal includes a document that is to be used in the project, or is to become part of the project record, other than as a submittal, do not apply the Contractor's approval stamp to the document itself, but to a separate sheet accompanying the document.

Provide data in the unit of measure used in the contract documents.

#### 1.5.2.2 Format for SD-02 Shop Drawings

Provide shop drawings not less than 8 1/2 by 11 inches nor more than 30 by 42 inches, except for full-size patterns or templates. Prepare drawings to accurate size, with scale indicated, unless another form is required. Ensure drawings are suitable for reproduction and of a quality to produce clear, distinct lines and letters, with dark lines on a white background.

a. Include the nameplate data, size, and capacity on drawings. Also include applicable federal, military, industry, and technical society publication references.

b. Dimension drawings, except diagrams and schematic drawings. Prepare drawings demonstrating interface with other trades to scale. Use the same unit of measure for shop drawings as indicated on the contract drawings. Identify materials and products for work shown.

Submit an electronic copy of drawings in PDF format.

##### 1.5.2.2.1 Drawing Identification

Include on each drawing the drawing title, number, date, and revision numbers and dates, in addition to information required in paragraph IDENTIFYING SUBMITTALS.

Number drawings in a logical sequence. Each drawing is to bear the number of the submittal in a uniform location next to the title block. Place the Government contract number in the margin, immediately below the title block, for each drawing.

1.5.2.3 Format of SD-03 Product Data

Present product data submittals for each section. Include a table of contents, listing the page and catalog item numbers for product data.

Indicate, by prominent notation, each product that is being submitted; indicate the specification section number and paragraph number to which it pertains.

1.5.2.3.1 Product Information

Supplement product data with material prepared for the project to satisfy the submittal requirements where product data does not exist. Identify this material as developed specifically for the project, with information and format as required for submission of SD-07 Certificates.

Provide product data in units used in the Contract documents. Where product data are included in preprinted catalogs with another unit, submit the dimensions in contract document units, on a separate sheet.

1.5.2.3.2 Standards

Where equipment or materials are specified to conform to industry or technical-society reference standards of such organizations as the American National Standards Institute (ANSI), ASTM International (ASTM), National Electrical Manufacturer's Association (NEMA), Underwriters Laboratories (UL), or Association of Edison Illuminating Companies (AEIC), submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. State on the certificate that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

1.5.2.3.3 Data Submission

Collect required data submittals for each specific material, product, unit of work, or system into a single submittal that is marked for choices, options, and portions applicable to the submittal. Mark each copy of the product data identically. Partial submittals will not be accepted for expedition of the construction effort.

Submit the manufacturer's instructions before installation.

1.5.2.4 Format of SD-04 Samples

1.5.2.4.1 Sample Characteristics

Furnish samples in the following sizes, unless otherwise specified or unless the manufacturer has prepackaged samples of approximately the same size as specified:

a. Sample of Equipment or Device: Full size.

b. Sample of Materials Less Than 2 by 3 inches: Built up to 8 1/2 by 11 inches.

c. Sample of Materials Exceeding 8 1/2 by 11 inches: Cut down to 8 1/2 by 11 inches and adequate to indicate color, texture, and material variations.

d. Sample of Linear Devices or Materials: 10 inch length or length to be supplied, if less than 10 inches. Examples of linear devices or materials are conduit and handrails.

e. Sample Volume of Nonsolid Materials: Pint. Examples of nonsolid materials are sand and paint.

f. Color Selection Samples: 2 by 4 inches. Where samples are specified for selection of color, finish, pattern, or texture, submit the full set of available choices for the material or product specified. Sizes and quantities of samples are to represent their respective standard unit.

g. Sample Panel: 4 by 4 feet.

h. Sample Installation: 100 square feet.

1.5.2.4.2 Sample Incorporation

Reusable Samples: Incorporate returned samples into work only if so specified or indicated. Incorporated samples are to be in undamaged condition at the time of use.

Recording of Sample Installation: Note and preserve the notation of any area constituting a sample installation, but remove the notation at the final clean-up of the project.

1.5.2.4.3 Comparison Sample

Samples Showing Range of Variation: Where variations in color, finish, pattern, or texture are unavoidable due to nature of the materials, submit sets of samples of not less than three units showing extremes and middle of range. Mark each unit to describe its relation to the range of the variation.

When color, texture, or pattern is specified by naming a particular manufacturer and style, include one sample of that manufacturer and style, for comparison.

1.5.2.5 Format of SD-05 Design Data

Provide design data and certificates on 8 1/2 by 11 inch page size.

1.5.2.6 Format of SD-06 Test Reports

By prominent notation, indicate each report in the submittal. Indicate the specification number and paragraph number to which each report pertains.

1.5.2.7 Format of SD-07 Certificates

Provide design data and certificates on 8 1/2 by 11 inch page size.

1.5.2.8 Format of SD-08 Manufacturer's Instructions

Present manufacturer's instructions submittals for each section. Include the manufacturer's name, trade name, place of manufacture, and catalog model or number on product data. Also include applicable federal, military, industry, and technical-society publication references. If supplemental information is needed to clarify the manufacturer's data, submit it as specified for SD-07 Certificates.

Submit the manufacturer's instructions before installation.

1.5.2.8.1 Standards

Where equipment or materials are specified to conform to industry or technical-society reference standards of such organizations as the American National Standards Institute (ANSI), ASTM International (ASTM), National Electrical Manufacturer's Association (NEMA), Underwriters Laboratories (UL), or Association of Edison Illuminating Companies (AEIC), submit proof of such compliance. The label or listing by the specified organization will be acceptable evidence of compliance. In lieu of the label or listing, submit a certificate from an independent testing organization, competent to perform testing, and approved by the Contracting Officer. State on the certificate that the item has been tested in accordance with the specified organization's test methods and that the item complies with the specified organization's reference standard.

1.5.2.9 Format of SD-09 Manufacturer's Field Reports

By prominent notation, indicate each report in the submittal. Indicate the specification number and paragraph number to which each report pertains.

1.5.2.10 Format of SD-10 Operation and Maintenance Data (O&M)

Comply with the requirements specified in Section 01 78 23 OPERATION AND MAINTENANCE DATA for O&M Data format.

1.5.2.11 Format of SD-11 Closeout Submittals

When the submittal includes a document that is to be used in the project or is to become part of the project record, other than as a submittal, do not apply the Contractor's approval stamp to the document itself, but to a separate sheet accompanying the document.

Provide data in the unit of measure used in the contract documents.

1.5.3 Source Drawings for Shop Drawings

1.5.3.1 Source Drawings

The entire set of source drawing files (DWG or DGN) will not be provided to the Contractor. Request the specific Drawing Number for the preparation of shop drawings. Only those drawings requested to prepare shop drawings will be provided. These drawings are provided only after award.

#### 1.5.3.2 Terms and Conditions

Data contained on these electronic files must not be used for any purpose other than as a convenience in the preparation of construction data for the referenced project. Any other use or reuse is at the sole risk of the Contractor and without liability or legal exposure to the Government. The Contractor must make no claim, and waives to the fullest extent permitted by law any claim or cause of action of any nature against the Government, its agents, or its subconsultants that may arise out of or in connection with the use of these electronic files. The Contractor must, to the fullest extent permitted by law, indemnify and hold the Government harmless against all damages, liabilities, or costs, including reasonable attorney's fees and defense costs, arising out of or resulting from the use of these electronic files.

These electronic source drawing files are not construction documents. Differences may exist between the source drawing files and the corresponding construction documents. The Government makes no representation regarding the accuracy or completeness of the electronic source drawing files, nor does it make representation to the compatibility of these files with the Contractor hardware or software. The Contractor is responsible for determining if any conflict exists. In the event that a conflict arises between the signed and sealed construction documents prepared by the Government and the furnished source drawing files, the signed and sealed construction documents govern. Use of these source drawing files does not relieve the Contractor of the duty to fully comply with the contract documents, including and without limitation the need to check, confirm and coordinate the work of all contractors for the project. If the Contractor uses, duplicates or modifies these electronic source drawing files for use in producing construction data related to this contract, remove all previous indication of ownership (seals, logos, signatures, initials and dates).

### 1.5.4 Electronic File Format

Provide submittals in electronic format, with the exception of material samples required for SD-04 Samples items. Compile the submittal file as a single, complete document, to include the Transmittal Form described within. Name the electronic submittal file specifically according to its contents, and coordinate the file naming convention with the Contracting Officer. Electronic files must be of sufficient quality that all information is legible. Use PDF as the electronic format, unless otherwise specified or directed by the Contracting Officer. All documents must make use of optical character recognition (OCR) routines to make text searchable and selectable, so that the text can be copied. Index and bookmark files exceeding 30 pages to allow efficient navigation of the file. When required, the electronic file must include a valid electronic signature.

E-mail electronic submittal documents smaller than 10MB to an e-mail address as directed by the Contracting Officer, unless directed otherwise by COR. Provide electronic documents over 10 MB on an optical disc or through an electronic file sharing system, such as secure ftp site or DoD SAFE located at the following website: https://safe.apps.mil/. Use of the Government web application must be initiated by the Government, unless Contractor has a Government CAC card. This Government web application restricts the number of days files are available to download.

## 1.6 QUANTITY OF SUBMITTALS

Submittals are to be transmitted electronically, unless directed otherwise.

### 1.6.1 Number of SD-04 Samples

a. Submit two samples, or two sets of samples showing the range of variation, of each required item. One approved sample or set of samples will be retained by the approving authority and one will be returned to the Contractor.

b. Submit one sample panel or provide one sample installation where directed. Include components listed in the technical section or as directed.

c. Submit one sample installation, where directed.

d. Submit one sample of nonsolid materials.

## 1.7 INFORMATION ONLY SUBMITTALS

Submittals without an action code must be certified by the QC manager and submitted to the Contracting Officer for information-only. Approval of the Contracting Officer is not required on information only submittals. The Contracting Officer will mark "receipt acknowledged" on submittals for information and will return only the transmittal cover sheet to the Contractor. Normally, submittals for information only will not be returned. However, the Government reserves the right to return unsatisfactory submittals and require the Contractor to resubmit any item found not to comply with the contract. This does not relieve the Contractor from the obligation to furnish material conforming to the plans and specifications; will not prevent the Contracting Officer from requiring removal and replacement of nonconforming material incorporated in the work; and does not relieve the Contractor of the requirement to furnish samples for testing by the Government laboratory or for check testing by the Government in those instances where the technical specifications so prescribe.

## 1.8 PROJECT SUBMITTAL REGISTER

A sample Project Submittal Register showing submittals required by the specifications is attached to this section as "Project Submittal Register."

### 1.8.1 Submittal Management

Prepare and maintain a submittal register, as the work progresses. Do not change data that is output in columns (c), (d), (e), and (f) as delivered by Government; retain data that is output in columns (a), (g), (h), and (i) as approved. As an attachment, provide a submittal register showing items of equipment and materials for which submittals are required by the specifications. This list may not be all-inclusive and additional submittals may be required. Maintain a submittal register for the project in accordance with Section 01 45 00.15 10 RESIDENT MANAGEMENT SYSTEM CONTRACTOR MODE(RMS CM). The Government will provide the initial submittal register in electronic format with the following fields completed, to the extent that will be required by the Government during subsequent usage.

Column (c): Lists specification section in which submittal is

required.

Column (d): Lists each submittal description (SD Number. and type, e.g., SD-02 Shop Drawings) required in each specification section.

Column (e): Lists one principal paragraph in each specification section where a material or product is specified. This listing is only to facilitate locating submitted requirements. Do not consider entries in column (e) as limiting the project requirements.

Thereafter, the Contractor is to track all submittals by maintaining a complete list, including completion of all data columns and all dates on which submittals are received by and returned by the Government.

1.8.2 Preconstruction Use of Submittal Register

Submit the submittal register as an electronic database, using the submittal management program furnished to Contractor, unless directed otherwise by COR. Include the QC plan and the project schedule. Verify that all submittals required for the project are listed and add missing submittals. Coordinate and complete the following fields on the register database submitted with the QC plan and the project schedule:

Column (a) Activity Number: Activity number from the project schedule.

Column (g) Contractor Submit Date: Scheduled date for the approving authority to receive submittals.

Column (h) Contractor Approval Date: Date that Contractor needs approval of submittal.

Column (i) Contractor Material: Date that Contractor needs material delivered to Contractor control.

1.8.3 Contractor Use of Submittal Register

Update the following fields in the Government-furnished submittal register program or equivalent fields in the program used by the Contractor with each submittal throughout the contract.

Column (b) Transmittal Number: List of consecutive, Contractor-assigned numbers.

Column (j) Action Code (k): Date of action used to record Contractor's review when forwarding submittals to QC.

Column (l) Date submittal transmitted.

Column (q) Date approval was received.

1.8.4 Approving Authority Use of Submittal Register

Update the following fields:

Column (b) Transmittal Number: List of consecutive,

Contractor-assigned numbers.

Column (l) Date submittal was received.

Column (m) through (p) Dates of review actions.

Column (q) Date of return to Contractor.

1.8.5 Action Codes

See paragraph Action Codes above.

1.8.6 Delivery of Copies

Submit an updated electronic copy of the submittal register to the Contracting Officer with each invoice request, unless a paper copy is requested by the Contracting Officer. Provide an updated Submittal Register monthly regardless of whether an invoice is submitted.

1.9 VARIATIONS

Variations from contract requirements require Contracting Officer approval pursuant to contract Clause FAR 52.236-21 Specifications and Drawings for Construction, and will be considered where advantageous to the Government.

1.9.1 Considering Variations

Discussion of variations with the Contracting Officer before submission will help ensure that functional and quality requirements are met and minimize rejections and resubmittals. When contemplating a variation that results in lower cost, consider submission of the variation as a Value Engineering Change Proposal (VECP).

Specifically point out variations from contract requirements in transmittal letters. Failure to point out variations may cause the Government to require rejection and removal of such work at no additional cost to the Government.

1.9.2 Proposing Variations

When proposing variations, deliver a written request to the Contracting Officer, with documentation of the nature and features of the variation and why the variation is desirable and beneficial to Government. Include the DOR's written analysis and approval. If lower cost is a benefit, also include an estimate of the cost savings. In addition to documentation required for variation, include the submittals required for the item. Clearly mark the proposed variation in all documentation.

Check the column "variation" of ENG Form 4025 for submittals that include variations proposed by the Contractor. Set forth in writing the reason for any variations and note such variations on the submittal. The Government reserves the right to rescind inadvertent approval of submittals containing unnoted variations.

1.9.3 Warranting that Variations are Compatible

When delivering a variation for approval, the Contractor warrants that this contract has been reviewed to establish that the variation, if incorporated, will be compatible with other elements of work.

1.9.4 Review Schedule Extension

In addition to the normal submittal review period, a period of 14 calendar days will be allowed for the Government to consider submittals with variations.

1.10 SCHEDULING

Schedule and submit concurrently product data and shop drawings covering component items forming a system or items that are interrelated. Submit pertinent certifications at the same time. No delay damages or time extensions will be allowed for time lost in late submittals. .

a. Coordinate scheduling, sequencing, preparing, and processing of submittals with performance of work so that work will not be delayed by submittal processing. The Contractor is responsible for additional time required for Government reviews resulting from required resubmittals. The review period for each resubmittal is the same as for the initial submittal.

b. Submittals required by the contract documents are listed on the submittal register. If a submittal is listed in the submittal register but does not pertain to the contract work, the Contractor is to include the submittal in the register and annotate it "N/A" with a brief explanation. Approval by the Contracting Officer does not relieve the Contractor of supplying submittals required by the contract documents but that have been omitted from the register or marked "N/A."

c. Resubmit the submittal register and annotate it monthly with actual submission and approval dates. When all items on the register have been fully approved, no further resubmittal is required.

Contracting Officer review will be completed within 20 calendar days after the date of submission.

The Government review period for each construction submittal does not begin until the submittal is delivered via RMS CM. Contract compliance for all submittals are the Contractor's responsibility. Government acceptance or receipt acknowledged does not remove this responsibility for contract compliance on any construction submittal.

1.11 GOVERNMENT APPROVING AUTHORITY

When the approving authority is the Contracting Officer, the Government will:

a. Note the date on which the submittal was received.

b. Review submittals for approval within the scheduling period specified and only for conformance with project design concepts and compliance with contract documents.

c. Identify returned submittals with one of the actions defined in paragraph REVIEW NOTATIONS and with comments and markings appropriate for the action indicated.

Upon completion of review of submittals requiring Government approval,

stamp and date submittals. An electronic copy of the submittal will be retained by the Contracting Officer and an electronic copy of the submittal will be returned to the Contractor. The Government may process submittals in the RMS CM System.

1.11.1 Review Notations

Submittals will be returned to the Contractor with the following notations:

a. Submittals marked "approved" or "accepted" authorize proceeding with the work covered.

b. Submittals marked "approved as noted" or "approved, except as noted, resubmittal not required," authorize proceeding with the work covered provided that the Contractor takes no exception to the corrections.

c. Submittals marked "not approved," "disapproved," or "revise and resubmit" indicate incomplete submittal or noncompliance with the contract requirements or design concept. Resubmit with appropriate changes. Do not proceed with work for this item until the resubmittal is approved.

d. Submittals marked "not reviewed" indicate that the submittal has been previously reviewed and approved, is not required, does not have evidence of being reviewed and approved by Contractor, or is not complete. A submittal marked "not reviewed" will be returned with an explanation of the reason it is not reviewed. Resubmit submittals returned for lack of review by Contractor or for being incomplete, with appropriate action, coordination, or change.

e. Submittals marked "receipt acknowledged" indicate that submittals have been received by the Government. This applies only to "information-only submittals" as previously defined.

1.12 DISAPPROVED SUBMITTALS

Make corrections required by the Contracting Officer. If the Contractor considers any correction or notation on the returned submittals to constitute a change to the contract drawings or specifications, give notice to the Contracting Officer as required under the FAR clause titled CHANGES. The Contractor is responsible for the dimensions and design of connection details and the construction of work. Failure to point out variations may cause the Government to require rejection and removal of such work at the Contractor's expense.

If changes are necessary to submittals, make such revisions and resubmit in accordance with the procedures above. No item of work requiring a submittal change is to be accomplished until the changed submittals are approved.

1.13 APPROVED SUBMITTALS

The Contracting Officer's approval of submittals is not to be construed as a complete check, and indicates only that the general method of construction, materials, detailing, and other information are satisfactory.

Approval or acceptance by the Government for a submittal does not relieve the Contractor of the responsibility for meeting the contract requirements

or for any error that may exist, because under the Quality Control (QC) requirements of this contract, the Contractor is responsible for ensuring information contained with in each submittal accurately conforms with the requirements of the contract documents.

After submittals have been approved or accepted by the Contracting Officer, no resubmittal for the purpose of substituting materials or equipment will be considered unless accompanied by an explanation of why a substitution is necessary.

1.14 APPROVED SAMPLES

Approval of a sample is only for the characteristics or use named in such approval and is not be construed to change or modify any contract requirements. Before submitting samples, provide assurance that the materials or equipment will be available in quantities required in the project. No change or substitution will be permitted after a sample has been approved.

Match the approved samples for materials and equipment incorporated in the work. If requested, approved samples, including those that may be damaged in testing, will be returned to the Contractor, at its expense, upon completion of the contract. Unapproved samples will also be returned to the Contractor at its expense, if so requested.

Failure of any materials to pass the specified tests will be sufficient cause for refusal to consider, under this contract, any further samples of the same brand or make as that material. The Government reserves the right to disapprove any material or equipment that has previously proved unsatisfactory in service.

Samples of various materials or equipment delivered on the site or in place may be taken by the Contracting Officer for testing. Samples failing to meet contract requirements will automatically void previous approvals. Replace such materials or equipment to meet contract requirements.

1.15 WITHHOLDING OF PAYMENT

Payment for materials incorporated in the work will not be made if required approvals have not been obtained.

1.16 STAMPS

Certify the submittal data as follows on Form ENG 4025: "I certify that the above submitted items had been reviewed in detail and are correct and in strict conformance with the contract drawings and specifications except as otherwise stated.

## INSTRUCTIONS

1. Section I will be initiated by the Contractor in the required number of copies.

2. Each Transmittal shall be numbered consecutively. The Transmittal Number typically includes two parts separated by a dash (-). The first part is the specification section number. The second part is a sequential number for the submittals under that spec section. If the Transmittal is a resubmittal, then add a decimal point to the end of the original Transmittal Number and begin numbering the resubmittal packages sequentially after the decimal.

3. The "Item No." for each entry on this form will be the same "Item No." as indicated on ENG FORM 4288-R.

4. Submittals requiring expeditious handling will be submitted on a separate ENG Form 4025-R.

5. Items transmitted on each transmittal form will be from the same specification section. Do not combine submittal information from different specification sections in a single transmittal.

6. If the data submitted are intentionally in variance with the contract requirements, indicate a variation in column h, and enter a statement in the Remarks block describing he detailed reason for the variation.

7. ENG Form 4025-R is self-transmitting - a letter of transmittal is not required.

8. When submittal items are transmitted, indicate the "Submittal Type" (*SD-01 through SD-11*) in column c of Section I.
   Submittal types are the following:
   SD-01 - Preconstruction SD-02 - Shop Drawings SD-03 - Product Data SD-04 - Samples SD-05 - Design Data SD-06 - Test Reports
   SD-07 - Certificates SD-08 - Manufacturer's Instructions SD-09 - Manufacturer's Field Reports SD-10 - O&M Data SD-11 - Closeout

9. For each submittal item, the Contractor will assign Submittal Action Codes in column g of Section I. The U.S. Army Corps of Engineers approving authority will assign Submittal Action Codes in column i of Section I. The Submittal Action Codes are:

   A – Approved as submitted.
   B – Approved, except as noted on drawings. Resubmission not required.
   C – Approved, except as noted on drawings. Refer to attached comments. Resubmission required.
   D – Will be returned by separate correspondence.
   E – Disapproved. Refer to attached comments.
   F – Receipt acknowledged.
   X – Receipt acknowledged, does not comply with contract requirements, as noted.
   G – Other action required *(Specify)*
   K – Government concurs with intermediate design. (*For D-B contracts*)
   R – Design submittal is acceptable for release for construction. (*For D-B contracts*)

10. Approval of items does not relieve the contractor from complying with all the requirements of the contract.

1.2 SUMMARY

This section includes requirements for Sustainability documentation and reporting submittals per the federally mandated High Performance and Sustainable Building (HPSB) or HPSB "Guiding Principles" (GP), in accordance with UFC 1-200-02 High Performance and Sustainable Building Requirements, and other identified requirements.

1.3 SUBMITTALS

Government approval is required for submittals with a "G". Submittals not having a "G" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Preliminary High Performance and Sustainable Building Checklist; G, RO

Sustainability Action Plan; G, RO

Preliminary Sustainability eNotebook; G, RO

SD-11 Closeout Submittals

Final High Performance and Sustainable Building Checklist; G, RO

Final Sustainability eNotebook; G, RO

The Sustainability eNotebook shall include all relevant documentation pertaining to HPSB and TPC compliance including, but not limited to:

Commissioning Reports
Energy Efficient Products
Indoor Water Use
Low Emitting Materials
Bio-Based Products
Recycled Content
Certification of EPA Designated Items
Certification of USDA Designated Items
Construction Waste Management
Sustainability Submittals

Amended Final Sustainability eNotebook; G, RO

Amended Final High Performance and Sustainable Building Checklist; G, RO

1.4 GUIDING PRINCIPLES VALIDATION (GPV)

Provide the following sustainability activities and documentation to verify achievement of HPSB Guiding Principles Validation (GPV):

a. Analysis of each Guiding Principle Requirement and how project complies. Include final government approved narrative(s) in the HPSB Checklist submittal. Multiple checklists indicate multiple buildings that require individual HPSB Checklist tracking.

b. No changes to the HPSB Checklist are allowed without approval from the Contracting Officer, in accordance with Section 01 33 00 SUBMITTAL PROCEDURESS. Immediately bring to the attention of the Contracting Officer any project changes that impact meeting the approved HPSB Guiding Principles Requirements for this project. Demonstrate the change will not increase the life-cycle cost and maintains or improves the building performance.

c. Documentation of all work required to incorporate the applicable HPSB Guiding Principles requirements indicated on the HPSB Checklist and in this contract, including all "S" submittals.

d. Sustainability Action Plan.

e. Construction related documentation for the project Sustainability eNotebook and keep updated with regularly-scheduled Construction Quality Control Meetings. Include construction related documentation containing the following components:

(1) HPSB Checklist(s)

(2) Sustainability Action Plan

(3) Documentation illustrating HPSB Guiding Principles Requirements compliance

1.4.1 Sustainability Action Plan

Include the following information in the Sustainability Action Plan:

a. Analysis of each HPSB Guiding Principles Requirement and how project will comply. Final government approved narrative(s) must be included in the HPSB Checklist submittal.

b. Name and contact information for: Contractor's Point of Contact (POC) ensuring sustainability goals are accomplished and documentation is assembled. For TPC that include on-site visit by third party representative, provide list of required attendees.

c. Indoor Air Quality plan.

1.4.2 Calculations

Provide all calculations, product data, labels and product certifications required in this specification to demonstrate compliance with the HPSB Guiding Principles Requirements.

1.5 SUSTAINABILITY SUBMITTALS

Provide HPSB Checklist and other documentation in the Sustainability eNotebook to indicate compliance with the sustainability requirements of the project.

1.5.1 High Performance Sustainable Building (HPSB) Checklist

Provide construction documentation that provides proof of, and supports compliance with, the completed HPSB Checklist.

1.5.1.1 HPSB Checklist Submittals

Submit updated HPSB Checklist with each Sustainability eNotebook submittal. Include the final HPSB Checklist(s) with the interim DD1354 Real Property Record Submittal.

### 1.5.2 Submittals for Sustainability Documentation

Various sections of this contract contain submittals the may count towards the sustainability documentation requirements required by this section. Submit the GPV sustainability documentation required in this section as part of the Sustainability eNotebook for all affected UFGS Sections.

a. Highlight GPV compliance data in each sustainability documentation submittal.

b. Bbookmark sustainability documentation submittals as required in paragraph SUSTAINABILITY ENOTEBOOK below.

c. Ensure all approved sustainability documentation submittals are included in each Sustainability eNotebook submittal.

### 1.5.3 Sustainability eNotebook

The Sustainability eNotebook is an electronic organizational file that serves as a repository for all required sustainability submittals. To support documentation of compliance with an approved HPSB checklist, provide and maintain a comprehensive and current Sustainability eNotebook. Include all required data in Sustainability eNotebook, to support full compliance with the HPSB Guiding Principles Requirements, including:

a. HPSB checklist

b. Sustainability Action Plan

c. Calculations

d. Labels

e. Sustainability documentation submittals contained in various UFGS sections of the contract

f. Certifications, assessments, or validations and compliance report

#### 1.5.3.1 Sustainability eNotebook Format

Provide Sustainability eNotebook in the form of an Adobe PDF file; bookmark each HPSB Guiding Principles Requirement and sub-bookmark at each document. Match format to HPSB Guiding Principles numbering system indicated herein. Maintain up-to-date information, such as spreadsheets, templates, with each current submittals.

Contracting Officer may deduct from the monthly progress payment accordingly if Sustainability eNotebook information is not current and on track per project goals.

#### 1.5.3.2 Sustainability eNotebook Submittal Schedule

Provide Sustainability eNotebook Submittals at the following milestones of the project:

a. Preliminary Sustainability eNotebook

Submit preliminary Sustainability eNotebook with updated Preliminary High Performance and Sustainable Building Checklist at the first post award meeting.

e. Construction Quality Control Meetings.

Provide up-to-date GP documentation in the Sustainability eNotebook for each meeting.

f. Final Sustainability eNotebook

Submit updated Sustainability eNotebook with updated Final High Performance and Sustainable Building Checklist at Beneficial Occupancy Date (BOD). Final progress payment retainage may be held by Contracting Officer until Final Sustainability construction phase documentation is complete.

g. Amended Final Sustainability eNotebook

Amend and resubmit the Amended Final Sustainability eNotebook with Amended Final High Performance and Sustainable Building Checklist, to include post-occupancy corrections, updates, and requirements. Final progress payment retainage may be held by Contracting Officer until amended final sustainability documentation is complete. Submit the Amended Final Sustainability eNotebook Submittal on DVDs to the Contracting Officer no later than 30 days after final GP determination.

## 1.6 DOCUMENTATION REQUIREMENTS

a. Incorporate each of the following HPSB Guiding Principles requirements into project and provide documentation that proves compliance with each listed requirement. Items below are organized by HPSB Guiding Principles. For life-cycle cost analysis requirements, one document with all analyses is acceptable, with Contracting Officer approval.

b. For each of the following paragraphs that require the use of products listed on Government-required websites, provide documentation of the process used to select products, or process used to determine why listed products do not meet project performance requirements.

### 1.6.1 Commissioning (Cx)

Develop and incorporate Commissioning requirements into the documents, in accordance with Section 01 91 00.15 10 TOTAL BUILDING COMMISSIONING.

### 1.6.2 Energy Efficient Products

Provide only energy-using products that are Energy Star rated or have Federal Energy Management Program (FEMP) recommended efficiency. Where Energy Star or FEMP recommendations have not been established, provide most efficient products that are life-cycle cost-effective. Provide only energy using products that meet FEMP requirements for low standby power consumption. Energy efficient products can be found at: https://www.energy.gov/eere/femp/federal-energy-management-program and http://www.energystar.gov/.

For construction submittal documentation, provide proof that product is

labeled energy efficient and complies with the cited requirements.

1.6.3 Building-level Power Metering

Provide building-level meters for electricity, natural gas, and steam where applicable.

1.6.3.1 Construction Submittal Documentation

Provide manufacturer's data validating compatibility with base-wide system and component advanced meter requirements.

1.6.4 Indoor Water Use

Provide Construction Documentation proof that fixtures are labeled EPA WaterSense, for products available with EPA WaterSense labeling; for all other fixtures, proof they comply with EPA WaterSense efficiency requirements.

1.6.5 Indoor Water Metering

Provide building-level meters for potable water use. Provide the requirements cited in the following paragraphs:

1.6.5.1 Construction Submittal Documentation

Provide manufacturer's data validating compatibility with base-wide system and component advanced meter requirements.

1.6.6 Outdoor Water Use

Where new irrigation is required, provide only non-potable sources. Provide the requirements cited in the following paragraphs:

1.6.6.1 Construction Submittal Documentation

Provide manufacturer's data validating compatibility with base-wide system and component advanced meter requirements.

1.6.7 Outdoor Water Meters

Provide meters for outdoor systems that use potable water. Provide the requirements cited in the following paragraphs:

1.6.7.1 Construction Submittal Documentation

Provide manufacturer's data validating compatibility with base-wide system and component advanced meter requirements.

1.6.8 Moisture Control

Provide the following:

1.6.8.1 Construction Submittal Documentation

Ensure construction materials are separated and protected in accordance with other sections in this contract document, with adequate humidity controls during construction. In accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA, includes plan for ongoing building

moisture control.

Coordinate with the moisture control requirements of Section 01 45 00.00 10 QUALITY CONTROL.

1.6.9 Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials)

Meet the requirements of Table 3-1 at the end of this specification.

For Construction submittal documentation, provide certifications or labels that demonstrate compliance with cited requirements, based on the attached TABLE 3-1.

1.6.10 Indoor Air Quality During Construction

Prior to construction, create indoor air quality plan. Develop and implement an IAQ construction management plan during construction and flush building air before occupancy.

For new construction and for renovation of unoccupied existing buildings, meet the requirements of ICC IGCC 1001.3.1.5 (10.3.1.4) Indoor Air Quality (IAQ) Construction Management.

Provide documentation showing that after construction ends and prior to occupancy, HVAC filters were replaced and building air was flushed out in accordance with the cited standard.

1.6.11 Recycled Content

Comply with 40 CFR 247. Refer to: https://www.epa.gov/smm/comprehensive-procurement-guideline-cpg-program for assistance identifying products cited in 40 CFR 247. Selected products must comply with non-proprietary requirements of the Federal Acquisition Regulation and must meet performance requirements.

1.6.11.1 Construction Submittal Documentation

a. Provide manufacturers' documents stating the recycled content by material, or written justification for claiming one of the exceptions allowed on the cited website.

b. Substitutions: Submit for Government approval for proposed alternative products or systems that provide equivalent performance and appearance and have greater contribution to project recycled content requirements. For all such proposed substitutions, submit with the Sustainability Action Plan accompanied by product data demonstrating equivalence.

c. In order to complete compliance with FAR 52.223-9 Estimate of Percentage of Recovered Material Content for EPA Designated Items and and FAR 52-223-17 Affirmative Procurement of EPA designated items in Service and Construction Contracts, submit the Certification of EPA Designated Items as part of the Final Sustainability eNotebook. Include on the certification form the following information: project name, project number, Contractor name, license number, Contractor address, and certification. The certification will read as follows and be signed and dated by the Contractor. "I hereby certify the information provided herein is accurate and that the requisition/procurement of all materials listed on this form comply

with current EPA standards for recycled/recovered materials content. The following exemptions may apply to the non-procurement of recycled/recovered content materials:.

(1) The product does not meet appropriate performance standards;

(2) The product is not available within a reasonable time frame;

(3) The product is not available competitively (from two or more sources);

(4) The product is only available at an unreasonable price (compared with a comparable non-recycled content product)."

Record each product used in the project that has a requirement or option of containing recycled content, noting total price, total value of post-industrial recycled content, total value of post-consumer recycled content, exemptions (1), (2), (3), or (4), as indicated, and comments. Recycled content values may be determined by weight or volume percent, but must be consistent throughout.

1.6.12 Bio-Based Products

Provide products and materials composed of the highest percentage of bio-based materials (including rapidly renewable resources and certified sustainably harvested products), consistent with FSRIA 9002 USDA BioPreferred Program, to the maximum extent possible without jeopardizing the intended end use or detracting from the overall quality delivered to the end user and when available at a reasonable cost. Use only supplies and materials of a type and quality that conform to applicable specifications and standards.

Comply with FSRIA 9002 USDA BioPreferred Program. Refer to www.biopreferred.gov for the product categories and BioPreferred Catalog. Selected products must comply with non-proprietary requirements of the Federal Acquisition Regulation and must meet performance requirements. Provide the following documentation:

a. USDA BioPreferred label for each product; for bio-based products used on project but not listed with BioPreferred program, provide bio-based content and percentage.

b. In order to complete compliance with FAR 52.223-1 Biobased Product Certification, refer to submittal requirement for biobased products in FSRIA 9002

1.6.13 Waste Material Management (Recycling – Construction)

Divert demolition and construction debris in accordance with Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL.

1.6.14 Additional Sustainability Requirements

The following requirements are included, as required by the project scope or the applied sustainability Third Party Certification program:

An air barrier shall be installed following the requirements in UFC 1-200-02 and UFC 3-101-01, but is not required to undergo pressure testing. See Section 07 27 10.10 BUILDING AIR BARRIER SYSTEM.

PART 2 PRODUCTS

Not used.

PART 3 EXECUTION

3.1 SUSTAINABILITY COORDINATION

Provide sustainability focus and coordination at all meetings to achieve sustainability goals. Coordinate meeting requirements with other UFGS Sections meeting requirements in this project. Ensure the designated sustainability professional responsible for GP documentation participates in these meetings to coordinate documentation completion. Review GP sustainability requirements, HPSB Checklist documentation, Sustainability Action Plan, and completeness status of Sustainability eNotebook at the following meetings:

a. Pre-Construction Conference

b. Construction Quality Control Meetings

g. Facility Turnover Meetings

Conduct review no later than 60 days before final turnover and identify any outstanding issues that affect correct completion of all documentation, and actions that will achieve requirements. Conduct corrective actions prior to turnover, to ensure all requirements are achieved.

3.2 TABLE 3-1 VOLATILE ORGANIC COMPOUNDS (VOC) (LOW EMITTING MATERIALS) REQUIREMENTS

**TABLE 3-1 Volatile Organic Compounds (VOC) (Low Emitting Materials) Requirements**

## SUSTAINABILITY DATA - GUIDING PRINCIPLES for SUSTAINABLE DEVELOPMENT

**OVERALL COMPLIANCE:**

◯ **Complies with UFC 1-200-02 and Agency Sustainability Policy Building**

◯ **does not meet the criteria for tracking in UFC 1-200-02/Policy**

◯ **An Exemption has been:** ◯ **Requested** ◯ **Granted** ◯ **N/A**

### BUILDING IDENTIFICATION:

**1** How many buildings are included in this project?

**2** Of those, which building is this form for?

**3** New building or stand-alone addition greater than or equal to 10,000 GSF? Yes ☐ No ☐

**- If project is for more than one building for which tracking is required, complete a separate form for each building.**

**- If an element was not achieved at project completion, mark "Not Attained" and include a justification in the "Not attained reason" field.**

### DOCUMENTATION OF COMPLIANCE WITH GUIDING PRINCIPLES

**I. Employ Integrated Design Principles**

1 Integrated Design

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

2 Commissioning

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

(i) Systems commissioned

**II. Optimize Energy Performance**

3. Energy Efficiency

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

(i) Energy Savings Below Baseline %

(ii) Energy Standard

☐ ASHRAE 90.1-2013 (06NOV16+) ☐ IECC
☐ ASHRAE 90.1-2016 ☐ OTHER:

C. Energy Efficient Products

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

4. Renewable Energy

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

A. Renewable energy technology types

☐ Geothermal ☐ Daylighting (quantified passive)
☐ Ground Source Heat Pumps ☐ Mechanical (i.e., direct water pumping)
☐ Solar Photovoltaic ☐ Micro-hydro
☐ Solar Thermal - domestic hot water ☐ Concentrating (sterling)
☐ Solar Thermal - space conditioning ☐ Wind

(i) Annual % of total load

(ii) System size (kwatts)

B. Solar Hot Water Percentage - 30% target

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

(i) Annual % of total load _____

(ii) System size (kBTU/Year) _____

5. Meter (Energy)

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

6. Energy Use Intensity kBTU/Sq Ft/Year

(i) Total Design Energy Use Intensity (EUI): kBTU/Sq Ft/Year

**III. Protect and Conserve Water**

7. Indoor Water Use

A. Water-Efficient Products

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

(i) Total Design Indoor Water Use Intensity (WUI): Gallons/Sq Ft/Year

B. Indoor Water Meter

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

8. Outdoor Water Use

A. Outdoor Water Meter (for 25,000 SF of irrigation)

(i) Is there a permanent irrigation system serving more than 25,000 SF of landscaping?

☐ Yes ☐ No

(ii) Water Meter

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

B. Water-efficient landscape

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

9. Alternative Water Use

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

Methods Used:

☐ Air Handler Condensate Capture ☐ Reclaimed Water
☐ Grey Water ☐ Treated Wastewater
☐ Harvested Rainwater ☐ OTHER:

10. Stormwater Management - update the LID Data tab

**IV. Enhance Indoor Environmental Quality**

11. Ventilation and Thermal Comfort

A. Ventilation

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

B. Thermal Comfort

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

12. Daylighting and Lighting Controls

A. Daylight

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

B. Automatic dimming controls

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

13. Indoor Air Quality

A. Moisture Control

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

B. Low-Emitting Materials

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

C. Indoor Air Quality during Construction

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

14. Occupant Health and Wellness

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

**V. Reduce the Environmental Impact of Materials**

15. Material Content and Performance

A. Resource Conservation and Recovery Act (RCRA) Section 6002 (recycled content)

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

B. Farm Security and Rural Investment Act (FSRIA) section 9002 (Biobased content)

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue
☐ Not LCCE ☐ Renovation only: not part of scope
☐ Installation/region issue

Not attained reason

16. Waste Management

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

17. Waste Diversion - 60% target

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

(i) Percent diverted _____

**VI. Assess and Consider Climate Change Risks**

18. Address Climate Change Risk

Attained In Compliance ☐ Yes ☐ N/A ☐ Not Attained

N/A due to

☐ Mission preclusion ☐ Building/site issue

☐ Not LCCE ☐ Renovation only: not part of scope

☐ Installation/region issue

Not attained reason

**THIRD PARTY CERTIFICATION INFORMATION**

Is this building pursuing Third Party Certification? ☐ Yes ☑ No

Reason not included: Project does not meet minimum threshold for TPC per UFC 1-200-02.

**Sustainability Third Party Certification Rating**

Third Party Certification Rating System and Level

☐ USGBC LEED Certified

☐ USGBC LEED Silver

☐ USGBC LEED Gold

☐ USGBC LEED Platinum

☐ USGBC "Guiding Principles Assessment"

ADVANCED MODELING (BIM/CIM/GIS/CAD) REQUIREMENTS
**10/15**

PART 1 GENERAL

This project includes BIM, CIM, GIS, and CAD requirements during Construction phase of the project.

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NATIONAL INSTITUTE OF BUILDING SCIENCES (NIBS)

| | |
|---|---|
| NBIMS-US | (V3) National BIM Standard - United States |
| NCS | (V6) United States National CAD Standard |

U.S. ARMY CORPS OF ENGINEERS (USACE)

| | |
|---|---|
| EM 1110-1-2909 | (2012) Geospatial Data and Systems |
| ERDC/ITL TR-12-1 | (2015) A/E/C Graphics Standard, Release 2.0 |
| ERDC/ITL TR-12-6 | (2019) A/E/C CAD Standard - Release 6.1 |

1.2 DEFINITIONS

1.2.1 Advanced Modeling

A subset of geospatial technologies as defined EM 1110-1-2909 GEOSPATIAL DATA AND SYSTEMS to include BIM, CIM, GIS, and CAD. Models and drawings that form a digital representation of the project, or part thereof, comprised of "Model Elements" with "Facility/Site Data."

1.2.2 Model Element

A self-contained element with a unique identification, whose behavior and properties are defined by Facility/Site Data and software processes. Model Elements can represent a physical entity, such as a pump, a concrete wall, or a utility vault and range from the simple to the complex.

1.2.3 Facility/Site Data

The non-graphical information attached to objects in the Model that defines various characteristics of the object. Facility/Site Data can include properties such as parametric values that drive physical sizes, material definitions and characteristics (e.g. wood, metal), manufacturer data, industry standards (e.g. AISC steel properties), and project identification numbers. Facility/Site Data can also define supplementary physical entities that are not shown graphically in the Model, such as the system of a duct, hardware on a door, content of conduit, or transformer properties.

1.2.4 USACE BIM/CIM Platform Configuration Standards - Templates, Workspaces, Catalogs, and Environments

a. Bentley AECOsim and InRoads Workspace:

The Workspace is contained within the A/E/C Work Structure. It is comprised of a collection of content libraries and supporting files that define and embody a BIM standard. Libraries include content such as wall types, standard steel shapes, furniture, HVAC fittings, and sprinkler heads. The Workspace also contains sheet libraries such as print/plot configurations, font and text style libraries, and sheet borders and title blocks. The Workspace includes pre-defined datagroup parameters.

b. USACE Revit Templates:

The USACE has developed Revit Templates specific to USACE BIM standards; these templates are Revit version specific. The USACE Revit templates are discipline specific and include family content pertinent to that discipline. The Templates share standard symbology such as annotation families, line styles, and text styles. The Templates include pre-defined shared parameters.

1.2.5 IFC

Industry Foundation Class, a standard and file format used for the exchange of BIM data; see www.iai-tech.org. For this specification, IFC does not mean "Issued For Construction."

1.2.6 Model Uses

Reference NBIMS-US A Model Use is a method or strategy of applying modeling during a facility's life cycle to achieve one or more specific objectives.

1.2.7 USACE CAD/BIM Technology Center

The USACE CAD/BIM Technology Center hosts all standard content for USACE. This content can be accessed through the CAD/BIM Technology Center website, https://cadbimcenter.erdc.dren.mil/.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Advanced Modeling Project Execution Plan (PxP); G, DO

PxP Demonstration

SD-03 Product Data

## 1.4 QUALITY ASSURANCE

### 1.4.1 Advanced Modeling Project Execution Plan (PxP)

Develop an Advanced Modeling Project Execution Plan ("Plan" or "PxP") documenting mandatory and Contractor-elected BIM Uses, analysis technologies and workflows.

Submit the PxP within forty-five (45) days after Notice to Proceed.

Contractors shall use the USACE ADVANCED MODELING (BIM) PROJECT EXECUTION PLAN (PxP) Template located at the USACE CAD/BIM Technology Center website to develop an acceptable Plan and update to include platforms and processes to meet the requirements of the project.

#### 1.4.1.1 USACE Minimum Modeling Matrix (M3)

The USACE Minimum Modeling Matrix (M3) describes the minimum modeling and data requirements by defining the Level of Development ("LOD") and Element Grade. Contractors shall use the M3 Template located at https://cadbimcenter.erdc.dren.mil/ and submit as part of the PxP.

Per instructions in the M3, Contractor is to identify elements included in the project scope and provide any applicable comments

### 1.4.2 PxP Demonstration

Within thirty (30) days after the acceptance of the PxP and M3, conduct a demonstration to review the Plan for clarification, and to verify the functionality of planned Model technology workflow and processes. If modifications are required, the Contractor shall complete the modifications and resubmit the PxP performing a subsequent demonstration for Government acceptance. There will be no payment for design or construction until the PxP is completed and accepted by the Government. The Government may also withhold payment for unacceptable performance in executing the accepted PxP.

### 1.4.3 Advanced Modeling Submittals

For each Advanced Modeling Submittal, provide the following:

#### 1.4.3.1 Approved PxP

The most recent approved PxP.

#### 1.4.3.2 List of Submitted Files

A list of all submitted electronic files including a description, directory, and file name for each file submitted. Identify which files have been produced from the Model and Facility/Site Data. For all Sheet files, include a list of the sheet titles and sheet numbers.

#### 1.4.3.3 Model Submittal Checklist

Complete the USACE BIM/CIM Submittal Checklist and submit with each submittal. Contractor can download the Checklist from the USACE CAD/BIM Technology Center.

1.4.3.4 Advanced Modeling Electronic Files

Include all Advanced Modeling files associated with the scope of work to be provided under this Contract. The Model(s) shall be developed, updated and maintained using Building Information Modeling (BIM), Civil Information Modeling (CIM), Geographic Information Systems (GIS), and Computer Aided Design (CAD) supplemented with drawing content as necessary to produce a complete set of Construction Documents.

1.4.3.5 3D Interactive Review Model

A copy of each BIM and CIM Model in an approved interactive review format.

1.4.3.6 IFC Coordination View

Provide an IFC Coordination View for all deliverables. Provide exported property set data for all IFC supported named building elements.

1.4.3.7 QC Reports

QC Reports will include the following:

1.4.3.7.1 Model Standards Checks and Reports

Provide QC checks demonstrating adherence to the NCS "BIM Implementation" section. Verify that the Project Facility/Site Data set has no undefined, incorrectly defined or duplicated elements. Identify and report non-compliant elements and submit a corrective action plan. Provide the Government with detailed justification and request Government acceptance for any non-compliant element that the Contractor proposes to be allowed to remain in the Model.

a. No errors when opening.

b. No broken Links, References, or X-References.

c. Minimized extraneous information.

d. Content uses the coordinate system defined in the approved PxP.

e. Models share a common alignment point.

f. Each discipline identified in the approved PxP is represented.

1.4.3.7.2 Graphics Standards Checks and Report

Provide QC checks on all graphic deliverables demonstrating that the fonts, dimensions, symbology and other construction document formatting are compliant with the requirements of this specification. Identify and report non-compliant content.

1.4.3.7.3 CAD Standards Checks and Report

Provide QC checks on CAD Output demonstrating that filenames, sheet borders, layer/level names, and symbology are compliant with the requirements of this specification. Identify and report non-compliant content. Identify and report non-compliant content.

1.4.3.7.4 Other Parameters

Develop such other QC parameters as Contractor deems appropriate for the Project and provide to the Government for acceptance

1.4.3.8 PDF Documents

Provide one PDF file per discipline and one additional PDF file combining all disciplines, following the A/E/C CAD Standard discipline and drawing order.

1.4.4 Advanced Modeling Re-Submittals

For each Advanced Modeling Re-Submittal, provide the following:

1.4.4.1 Government Comments and Contractor Responses

Provide a response to each Government comment for backcheck.

1.4.5 Meetings

1.4.5.1 Pre-Construction Meeting

At minimum discuss the following during the meeting:

a. The requirement for Advanced Modeling deliverables under this Contract.

b. Primary roles and responsibilities associated with the development and delivery of the Advanced Modeling submittals under this Contract.

c. Identify and agree upon a date and attendance list for the meetings described below:

1.4.5.2 Advanced Modeling Kick-Off Meeting

Conduct an Advanced Modeling Kick-Off Meeting prior to submission of the PxP, within forty-five (45) days after Notice to Proceed. This meeting must include, at a minimum, the Contractor and the Geographic District BIM Manager or delegate.

The intent of this meeting is to coordinate the Government's and the Contractor's expectations for the PxP.

1.4.5.3 PxP Demonstration Meeting

Within thirty (30) days after the acceptance of the PxP and M3, conduct a demonstration to review the Plan for clarification, and to verify the functionality of planned Model technology workflow and processes. If modifications are required, the Contractor shall complete the modifications and resubmit the PxP performing a subsequent demonstration for Government acceptance. There will be no payment for design or construction until the PxP is completed and accepted by the Government. The Government may also withhold payment for unacceptable performance in executing the accepted PxP.

1.5 OWNERSHIP AND RIGHTS OF DATA

The Government has ownership of and rights at the date of Closeout

Submittal to all CAD files, BIM/CIM Model(s), and Facility/Site Data developed for the Project in accordance with FAR Part 27, clauses incorporated in Section 00 72 00, GENERAL CONDITIONS (Contract Clauses) and Section 00 73 00 SPECIAL CONDITIONS Special Contract Requirement 1.14 GOVERNMENT RE-USE OF DESIGN. The Government may make use of this data following any deliverable.

## 1.6 DELIVERY, STORAGE, AND HANDLING

Deliver Advanced Modeling submittals in an organized and legible manner. Provide submittals adhering to the requirements of 01 33 00 SUBMITTAL REQUIREMENTS.

### 1.6.1 Number of Copies

Provide three identical copies of disks for approval, for each submittal and each facility required. Provide on approved electronic media (one copy per disk or set of disks) as defined below. Provide submittal files on electronic storage media in compliance with the quality requirements identified in this specification.

### 1.6.2 Malicious Content

Scan all files for malicious viruses using commercially available scanning program that is routinely updated to identify and remove current virus threats.

### 1.6.3 Storage Media

Provide facility data on disk-based (DVD-R/RW) media. Any deviations from the required storage media must be approved by the Government. Select and apply technology used for electronic data transmission to ensure that the full submittal is provided on one single disk, whenever possible. When separation of the submittal is required separate the each site or facility onto separate media. Any further divisions must be documented in the PxP and approved by the Government.

#### 1.6.3.1 Disk-Based Media

a. Apply a label directly printed to storage media. Do not provide adhesive, paper-based labels. List the name of the facility, project, project location, Contract number, Designer of Record firm/Prime Contractor company's name, title of submission, and security classification (in accordance with the appropriate security classification labeling regulations) on the label. If multiple disks are provided, clearly document the contents of each disk on the label.

b. Include the name and contact information of the individual who produced the final data disk to ensure that any problems with the data or media can be easily resolved.

c. When browsed on any computer, the disk must display the following folders and their associated content:

(1) Submittal XXXXXX-X.X (Containing all submittal data)
(2) PxP (Containing 1 PxP per contract)
(3) Readme (Containing 1 TXT, PDF, or HTML file with general use information, organizational instructions, and basic preparer contact information. Include all information included on the

storage media label.

1.6.4 Encryption

Encrypt deliverable data as directed by Project Office Engineer. Document the encryption to be used in the PxP.

PART 2 PRODUCTS

2.1 GOVERNMENT FURNISHED MATERIALS

The Government will provide Advanced Modeling files as Government Furnished Material (GFM) for the Contractor's use. The information and level of detail contained in the GFM shall be maintained in the Record Models and Record CAD files. The record CAD files are to be derived from the record models.

The Contractor has the option of preparing their own BIM/CIM models and CAD drawings as a basis for record model(s), record CAD drawings, and interim submittals. If so, the models must incorporate the same level of detail, properties, and functionality that is included in the GFM.

2.1.1 GFM Handover

The Government will provide the GFM at the Advanced Modeling Kick-Off Meeting.

2.1.2 GFM File Formats

GFM will be provided in the following file formats:

2.1.2.1 Government Furnished BIM

The GFM will include Autodesk Revit 2016.

2.1.2.2 Government Furnished CIM

The GFM will include Bentley Systems MicroStation InRoads V8i.

2.1.2.3 Government Furnished CAD

The GFM will include Bentley Systems MicroStation V8i.

2.1.3 Variation with Contract Drawings

The Government makes no warranty that any of the GFM are complete or fully consistent with the contract drawings. The digital files provided are not part of the contract documents. If there is any discrepancy between the BIM/CIM models, the CAD drawings, and the contract drawings, the contract drawings shall govern. The Government has no responsibility to modify any GFMs due to changes in the design that occur after award.

2.1.4 Model Completion and Quality

The Government makes no guarantee that the BIM/CIM models and CAD files provide the level of completeness or quality required for closeout submittal. It is the Contractor's responsibility to complete the models and facility data to completely and correctly represent the as-built conditions of the facility and the site.

2.1.5 Data Loss, Corruption, and Error

Transfer of GFM files to the Contractor may result in corrupted files resulting in data loss and/or errors. Use of GFM files is at the Contractor's risk. Verify data integrity upon receipt and request a replacement if necessary.

Any adjustment of file structure, format, or software version required to make GFM compatible with the Contractor's computer systems and/or software is the responsibility of the Contractor.

2.2 SYSTEM PLATFORM AND FILE FORMATS

The Contractor shall use the BIM, CIM, and CAD application(s), software(s), and file format(s) described below:

2.2.1 BIM

The BIM submittal format will be Autodesk Revit. The BIM submittals shall be fully operable, compatible, and editable within the native BIM/CIM tools.

2.2.2 CIM

The CIM submittal format will be Bentley Systems InRoads. The CIM submittals shall be fully operable, compatible, and editable within the native BIM/CIM tools.

2.2.3 CAD

The CAD submittal format will be Bentley MicroStation V8i.

2.2.4 Other Formats

PART 3 EXECUTION

3.1 ADVANCED MODELING REQUIREMENTS

3.1.1 BIM and CIM

All BIM and CIM content authoring, model coordination, content delivery and all other activities and products shall comply with the NCS BIM Implementation section, part "3.0 Basic BIM Guidelines."

All CAD content produced within the BIM and CIM authoring platforms shall comply with the NCS BIM Implementation section, part "2.0 Clarifications."

3.1.1.1 Minimum Modeling Requirements

Model to the requirements of the USACE M3 .

3.1.1.2 USACE Software Configuration Standards

a. USACE Bentley Workspace using version contained in GFM.. Download from the USACE CAD/BIM Technology Center website as part of the A/E/C Work Structure.

b. USACE Revit Templates using version contained in GFM.. Download

from the USACE CAD/BIM Technology Center website and, if required, upgrade to the Contract approved software version.

3.1.1.3 Classification

All modeled elements shall include Facility/Site Data referencing one or more classification system(s) indentified in the M3.

3.1.1.4 Space/Room Data

The Model shall include spatial data defining actual net square footage and data to develop the room finish schedule, including room names and numbers. Include program information to verify design space against programmed space, using this information to validate area quantities.

3.1.1.5 BIM Coordinate System

a. State Plane Coordinate System: Colorado
b. Zone: Central
c. Units: Imperial Survey Feet
d. Horizontal Datum: NAD 83
e. Vertical Datum: NAVD 88

3.1.1.6 CIM Coordinate System

a. State Plane Coordinate System: Colorado
b. Zone: Central
c. Units: Imperial Survey Feet
d. Horizontal Datum: NAD 83
e. Vertical Datum: NAVD 88

3.1.1.7 Schedules

Schedules shall comply with the NCS BIM Implementation section, part "2.4 Schedules." Schedules shall be produced from, and remain linked to, the Facility/Site Data within the Model. Any exceptions must be documented in the PxP and submitted to the Geographic BIM Manager, or delegate, for review.

3.1.1.8 Details and Enlarged Sections

Details and enlarged sections shall comply with the NCS BIM Implementation section, part "3.2 Model Coordination and Delivery." All details and enlarged sections necessary for construction shall be derived from the Model when possible. For those details and enlarged sections not derived directly from the Model, Contractor must verify that geometry and data depicting the details and enlarged sections are consistent with Model elements. Details with significant drafted content such as 'standard' and 'typical' details shall not contradict the model and shall utilize the model as an underlay when possible for the purposes of verification and coordination. Three dimensional, isometric, and section isometric details derived from the model are preferred. Details and enlarged sections that are not derived from the Model must created using native authoring tools within the Model or be embedded within the Model.

3.1.1.9 Drawing Indices

Drawing indices shall comply with the NCS BIM Implementation section, part "2.3 Sheet Organization." Where BIM authoring platform supports it,

drawing indices should be derived from a model-driven schedule.

3.1.1.10 CAD Export

CAD content exported form a BIM or CIM modeling platform shall comply with the NCS BIM Implementation section, part "2.0 Clarifications."

3.1.2 CAD

All CAD content produced through native CAD authoring software outside of any BIM or CIM platform shall be compliant with ERDC/ITL TR-12-6 A/E/C CAD Standard and ERDC/ITL TR-12-1 A/E/C Graphic Standard.

3.1.2.1 USACE Software Standards

a. Bentley MicroStation Seed Files Most recent version at the time of Contract award. Download from the CAD/BIM Technology Center website as part of the A/E/C Work Structure.

3.2 FINAL DESIGN AND FINAL RECORD SUBMITTAL REQUIREMENTS

Follow requirements for Content Delivery from the NCS BIM Implementation section, part "3.0 Basic BIM Guidelines."

3.3 PDF REQUIREMENTS

3.3.1 PDF Bookmarks

3.3.1.1 Construction Document Boookmarks

Bookmark construction document PDF sets to include one Parent Bookmark per Discipline and one Child Bookmark per sheet within each Discipline. Format Parent Bookmarks as "<Discipline>" (i.e. Architectural). Format Child Bookmarks as "<Sheet ID> <Sheet Title>" (i.e. A-101 First Floor Plan).

3.3.1.2 As-Built Bookmarks

Bookmark each RFI, modification, or red-line drawing. Format each As-Built Bookmark as "<Sheet ID> <Sheet Title> <RFI/Modification/Red-Line> <RFI/Modification/Red-Line #>" (i.e. A-101 First Floor Plan RFI 0001).

3.3.2 Hyperlinks

Hyperlink all reference annotation symbology (e.g. section cut symbology, detail callout symbology, elevation callout symbology, etc.) to the sheet referenced by the annotation.

3.4 MODEL USES

Include all of the following Model Uses in the Project Execution Plan (PxP).

3.4.1 Mandatory Model Uses

The following Model Uses are mandatory:

3.4.1.1 Design Phase Mandatory Model Uses

a. Design Authoring

b. 3D Coordination
c. Progress Review

3.4.1.2 Construction Phase Mandatory Model Uses

a. 3D Coordination
b. Record Modeling

3.4.2 Optional Model Uses

Contractor may use other Model Uses as desired.

3.5 AS-BUILT REQUIREMENTS

See Section 01 78 39.00.24 AS-BUILT DRAWINGS for additional as-built and record model quality and deliverable requirements. Deliverable requirements listed in that specification shall not preclude development of the project in BIM/CIM through design and construction as required herein.

## 1.2 DEFINITIONS

### 1.2.1 Competent Person (CP)

The CP is a person designated in writing, who, through training, knowledge and experience, is capable of identifying, evaluating, and addressing existing and predictable hazards in the working environment or working conditions that are dangerous to personnel, and who has authorization to take prompt corrective measures with regards to such hazards.

### 1.2.2 Competent Person, Confined Space

The CP, Confined Space, is a person meeting the competent person requirements as defined EM 385-1-1 Appendix Q, with thorough knowledge of OSHA’s Confined Space Standard, 29 CFR 1910.146, and designated in writing to be responsible for the immediate supervision, implementation and monitoring of the confined space program, who through training, knowledge and experience in confined space entry is capable of identifying, evaluating and addressing existing and potential confined space hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

### 1.2.3 Competent Person, Cranes and Rigging

The CP, Cranes and Rigging, as defined in EM 385-1-1 Appendix Q, is a person meeting the competent person, who has been designated in writing to be responsible for the immediate supervision, implementation and monitoring of the Crane and Rigging Program, who through training, knowledge and experience in crane and rigging is capable of identifying, evaluating and addressing existing and potential hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

### 1.2.4 Competent Person, Excavation/Trenching

A CP, Excavation/Trenching, is a person meeting the competent person requirements as defined in EM 385-1-1 Appendix Q and 29 CFR 1926, who has been designated in writing to be responsible for the immediate supervision, implementation and monitoring of the excavation/trenching program, who through training, knowledge and experience in excavation/trenching is capable of identifying, evaluating and addressing existing and potential hazards and, who has the authority to take prompt

corrective measures with regard to such hazards.

1.2.5 Competent Person, Fall Protection

The CP, Fall Protection, is a person meeting the competent person requirements as defined in EM 385-1-1 Appendix Q and in accordance with ASSP Z359.0, who has been designated in writing by the employer to be responsible for immediate supervising, implementing and monitoring of the fall protection program, who through training, knowledge and experience in fall protection and rescue systems and equipment, is capable of identifying, evaluating and addressing existing and potential fall hazards and, who has the authority to take prompt corrective measures with regard to such hazards.

1.2.6 Competent Person, Scaffolding

The CP, Scaffolding is a person meeting the competent person requirements in EM 385-1-1 Appendix Q, and designated in writing by the employer to be responsible for immediate supervising, implementing and monitoring of the scaffolding program. The CP for Scaffolding has enough training, knowledge and experience in scaffolding to correctly identify, evaluate and address existing and potential hazards and also has the authority to take prompt corrective measures with regard to these hazards. CP qualifications must be documented including experience on the specific scaffolding systems/types being used, assessment of the base material that the scaffold will be erected upon, load calculations for materials and personnel, and erection and dismantling. The CP for scaffolding must have a documented minimum of 8-hours of scaffold training to include training on the specific type of scaffold being used (e.g. mast-climbing, adjustable, tubular frame), in accordance with EM 385-1-1 Section 22.B.02.

1.2.7 Competent Person (CP) Trainer

A competent person trainer as defined in EM 385-1-1 Appendix Q, who is qualified in the training material presented, and who possesses a working knowledge of applicable technical regulations, standards, equipment and systems related to the subject matter on which they are training Competent Persons. A competent person trainer must be familiar with the typical hazards and the equipment used in the industry they are instructing. The training provided by the competent person trainer must be appropriate to that specific industry. The competent person trainer must evaluate the knowledge and skills of the competent persons as part of the training process.

1.2.8 High Risk Activities

High Risk Activities are activities that involve work at heights, crane and rigging, excavations and trenching, scaffolding, electrical work, and confined space entry.

1.2.9 High Visibility Accident

A High Visibility Accident is any mishap which may generate publicity or high visibility.

1.2.10 Load Handling Equipment (LHE)

LHE is a term used to describe cranes, hoists and all other hoisting equipment (hoisting equipment means equipment, including crane, derricks,

hoists and power operated equipment used with rigging to raise, lower or horizontally move a load).

1.2.11 Medical Treatment

Medical Treatment is treatment administered by a physician or by registered professional personnel under the standing orders of a physician. Medical treatment does not include first aid treatment even when provided by a physician or registered personnel.

1.2.12 Near Miss

A Near Miss is a mishap resulting in no personal injury and zero property damage, but given a shift in time or position, damage or injury may have occurred (e.g., a worker falls off a scaffold and is not injured; a crane swings around to move the load and narrowly misses a parked vehicle).

1.2.13 Operating Envelope

The Operating Envelope is the area surrounding any crane or load handling equipment. Inside this "envelope" is the crane, the operator, riggers and crane walkers, other personnel involved in the operation, rigging gear between the hook, the load, the crane's supporting structure (i.e. ground or rail), the load's rigging path, the lift and rigging procedure.

1.2.14 Qualified Person (QP)

The QP is a person designated in writing, who, by possession of a recognized degree, certificate, or professional standing, or extensive knowledge, training, and experience, has successfully demonstrated their ability to solve or resolve problems related to the subject matter, the work, or the project.

1.2.15 Qualified Person, Fall Protection (QP for FP)

A QP for FP is a person meeting the definition requirements of EM 385-1-1 Appendix Q, and ASSP Z359.2 standard, having a recognized degree or professional certificate and with extensive knowledge, training and experience in the fall protection and rescue field who is capable of designing, analyzing, and evaluating and specifying fall protection and rescue systems.

1.2.16 Recordable Injuries or Illnesses

Recordable Injuries or Illnesses are any work-related injury or illness that results in:

a. Death, regardless of the time between the injury and death, or the length of the illness;

b. Days away from work (any time lost after day of injury/illness onset);

c. Restricted work;

d. Transfer to another job;

e. Medical treatment beyond first aid;

f. Loss of consciousness; or

g. A significant injury or illness diagnosed by a physician or other licensed health care professional, even if it did not result in (a) through (f) above

1.2.17 Government Property and Equipment

Interpret "USACE" property and equipment specified in USACE EM 385-1-1 as Government property and equipment.

1.2.18 Load Handling Equipment (LHE) Accident or Load Handling Equipment Mishap

A LHE accident occurs when any one or more of the eight elements in the operating envelope fails to perform correctly during operation, including operation during maintenance or testing resulting in personnel injury or death; material or equipment damage; dropped load; derailment; two-blocking; overload; or collision, including unplanned contact between the load, crane, or other objects. A dropped load, derailment, two-blocking, overload and collision are considered accidents, even though no material damage or injury occurs. A component failure (e.g., motor burnout, gear tooth failure, bearing failure) is not considered an accident solely due to material or equipment damage unless the component failure results in damage to other components (e.g., dropped boom, dropped load, or roll over). Document an LHE mishap using the Crane High Hazard working group mishap reporting form (Available at local USACE Safety Office).

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

## 1.4 MONTHLY EXPOSURE REPORTS

Provide a Monthly Exposure Report and attach to the monthly billing request. This report is a compilation of employee-hours worked each month for all site workers, both Prime and subcontractor. Failure to submit the report may result in retention of up to 10 percent of the voucher.

## 1.5 REGULATORY REQUIREMENTS

In addition to the detailed requirements included in the provisions of this Contract, comply with the most recent edition of USACE EM 385-1-1, and the following federal, state, and local laws, ordinances, criteria, rules and regulations. Submit matters of interpretation of standards to the appropriate administrative agency for resolution before starting work. Where the requirements of this specification, applicable laws, criteria, ordinances, regulations, and referenced documents vary, the most stringent requirements govern.

## 1.6 SITE QUALIFICATIONS, DUTIES, AND MEETINGS

### 1.6.1 Personnel Qualifications

#### 1.6.1.1 Site Safety and Health Officer (SSHO)

Provide an SSHO that meets the requirements of EM 385-1-1 Section 1. The SSHO must ensure that the requirements of 29 CFR 1926.16 are met for the project. Provide a Safety oversight team that includes a minimum of one person at each project site to function as the Site Safety and Health Officer (SSHO). The SSHO or an equally-qualified Alternate SSHO must be at the work site at all times to implement and administer the Contractor's safety program and Government-accepted Accident Prevention Plan. The SSHO and Alternate SSHO must have the required training, experience, and qualifications in accordance with EM 385-1-1 Section 01.A.17, and all associated sub-paragraphs.

If the SSHO is off-site for a period longer than 24 hours, an equally-qualified alternate SSHO must be provided and must fulfill the same roles and responsibilities as the primary SSHO. When the SSHO is temporarily (up to 24 hours) off-site, a Designated Representative (DR), as identified in the AHA may be used in lieu of an Alternate SSHO, and must be on the project site at all times when work is being performed. Note that the DR is a collateral duty safety position, with safety duties in addition to their full time occupation.

1.6.1.1.1 Additional Site Safety and Health Officer (SSHO) Requirements and Duties

The SSHO may not serve as the Quality Control Manager. The SSHO may not serve as the Superintendent.

1.6.1.2 Competent Person Qualifications

Provide Competent Persons in accordance with EM 385-1-1, Appendix Q and herein. Competent Persons for high risk activities include confined space, cranes and rigging, excavation/trenching, fall protection, and electrical work. The CP for these activities must be designated in writing, and meet the requirements for the specific activity (i.e. competent person, fall protection).

The Competent Person identified in the Contractor's Safety and Health Program and accepted Accident Prevention Plan, must be on-site at all times when the work that presents the hazards associated with their professional expertise is being performed. Provide the credentials of the Competent Persons(s) to the Contracting Officer for information in consultation with the Safety Office.

1.6.1.2.1 Competent Person for Confined Space Entry

Provide a Confined Space (CP) Competent Person who meets the requirements of EM 385-1-1, Appendix Q, and herein. The CP for Confined Space Entry must supervise the entry into each confined space in accordance with EM 385-1-1, Section 34.

1.6.1.2.2 Competent Person for Scaffolding

Provide a Competent Person for Scaffolding who meets the requirements of EM 385-1-1, Section 22.B.02 and herein.

1.6.1.2.3 Competent Person for Fall Protection

Provide a Competent Person for Fall Protection who meets the requirements of EM 385-1-1, Section 21.C.04, 21.B.03, and herein.

1.6.1.3 Qualified Trainer Requirements

Individuals qualified to instruct the 40 hour contract safety awareness course, or portions thereof, must meet the definition of a Competent Person Trainer, and, at a minimum, possess a working knowledge of the following subject areas: EM 385-1-1, Electrical Standards, Lockout/Tagout, Fall Protection, Confined Space Entry for Construction; Excavation, Trenching and Soil Mechanics, and Scaffolds in accordance with 29 CFR 1926.450, Subpart L.

Instructors are required to:

a. Prepare class presentations that cover construction-related safety requirements.

b. Ensure that all attendees attend all sessions by using a class roster signed daily by each attendee. Maintain copies of the roster for at least five years. This is a certification class and must be attended 100 percent. In cases of emergency where an attendee cannot make it to a session, the attendee can make it up in another class session for

the same subject.

c. Update training course materials whenever an update of the EM 385-1-1 becomes available.

d. Provide a written exam of at least 50 questions. Students are required to answer 80 percent correctly to pass.

e. Request, review and incorporate student feedback into a continuous course improvement program.

1.6.1.4 Crane Operators/Riggers

Provide Operators, Signal Persons, and Riggers meeting the requirements in EM 385-1-1, Section 15.B for Riggers and Section 16.B for Crane Operators and Signal Persons. In addition, for mobile cranes with Original Equipment Manufacturer (OEM) rated capacities of 50,000 pounds or greater, designate crane operators qualified by a source that qualifies crane operators (i.e., union, a Government agency, or an organization that tests and qualifies crane operators). Provide proof of current qualification.

1.6.2 Personnel Duties

1.6.2.1 Duties of the Site Safety and Health Officer (SSHO)

The SSHO must:

a. Conduct daily safety and health inspections and maintain a written log which includes area/operation inspected, date of inspection, identified hazards, recommended corrective actions, estimated and actual dates of corrections. Attach safety inspection logs to the Contractors' daily production report.

b. Conduct mishap investigations and complete required accident reports. Report mishaps and near misses.

c. Use and maintain OSHA's Form 300 to log work-related injuries and illnesses occurring on the project site for Prime Contractors and subcontractors, and make available to the Contracting Officer upon request. Post and maintain the Form 300A on the site Safety Bulletin Board.

d. Maintain applicable safety reference material on the job site.

e. Attend the pre-construction conference, pre-work meetings including preparatory meetings, and periodic in-progress meetings.

f. Review the APP and AHAs for compliance with EM 385-1-1, and approve, sign, implement and enforce them.

g. Establish a Safety and Occupational Health (SOH) Deficiency Tracking System that lists and monitors outstanding deficiencies until resolution.

h. Ensure subcontractor compliance with safety and health requirements.

i. Maintain a list of hazardous chemicals on site and their material Safety Data Sheets (SDS).

j. Maintain a weekly list of high hazard activities involving energy, equipment, excavation, entry into confined space, and elevation, and be prepared to discuss details during QC Meetings.

k. Provide and keep a record of site safety orientation and indoctrination for Contractor employees, subcontractor employees, and site visitors.

Superintendent, QC Manager, and SSHO are subject to dismissal if the above or any other required duties are not being effectively carried out. If either the Superintendent, QC Manager, or SSHO are dismissed, project work will be stopped and will not be allowed to resume until a suitable replacement is approved and the above duties are again being effectively carried out.

1.6.3 Meetings

1.6.3.1 Preconstruction Conference

a. Contractor representatives who have a responsibility or significant role in accident prevention on the project must attend the preconstruction conference. This includes the project superintendent, Site Safety and Occupational Health Officer, quality control manager, or any other assigned safety and health professionals who participated in the development of the APP (including the Activity Hazard Analyses (AHAs) and special plans, program and procedures associated with it).

b. Discuss the details of the submitted APP to include incorporated plans, programs, procedures and a listing of anticipated AHAs that will be developed and implemented during the performance of the Contract. This list of proposed AHAs will be reviewed and an agreement will be reached between the Contractor and the Contracting Officer as to which phases will require an analysis. In addition, establish a schedule for the preparation, submittal, and Government review of AHAs to preclude project delays.

c. Deficiencies in the submitted APP, identified during the Contracting Officer's review, must be corrected, and the APP re-submitted for review prior to the start of construction. Work is not permitted to begin until an APP is established that is acceptable to the Contracting Officer.

1.6.3.2 Safety Meetings

Conduct safety meetings to review past activities, plan for new or changed operations, review pertinent aspects of appropriate AHA (by trade), establish safe working procedures for anticipated hazards, and provide pertinent Safety and Occupational Health (SOH) training and motivation. Conduct meetings at least once a month for all supervisors at the project location. The SSHO, supervisors, foremen, or CDSOs must conduct meetings at least once a week for the trade workers. Document meeting minutes to include the date, persons in attendance, subjects discussed, and names of individual(s) who conducted the meeting. Maintain documentation on-site and furnish copies to the Contracting Officer on request. Notify the Contracting Officer of all scheduled meetings 7 calendar days in advance.

## 1.7 ACCIDENT PREVENTION PLAN (APP)

### 1.7.1 APP - Construction

A qualified person must prepare the written site-specific APP. Prepare the APP in accordance with the format and requirements of EM 385-1-1, Appendix A, and as supplemented herein. Cover all paragraph and subparagraph elements in EM 385-1-1, Appendix A. The APP must be job-specific and address any unusual or unique aspects of the project or activity for which it is written. The APP must interface with the Contractor's overall safety and health program referenced in the APP in the applicable APP element, and made site-specific. Describe the methods to evaluate past safety performance of potential subcontractors in the selection process. Also, describe innovative methods used to ensure and monitor safe work practices of subcontractors. The Government considers the Prime Contractor to be the "controlling authority" for all work site safety and health of the subcontractors. Contractors are responsible for informing their subcontractors of the safety provisions under the terms of the Contract and the penalties for noncompliance, coordinating the work to prevent one craft from interfering with or creating hazardous working conditions for other crafts, and inspecting subcontractor operations to ensure that accident prevention responsibilities are being carried out. The APP must be signed by an officer of the firm (Prime Contractor senior person), the individual preparing the APP, the on-site superintendent, the designated SSHO, the Contractor Quality Control Manager, and any designated Certified Safety Professional (CSP) or Certified Health Physicist (CIH). The SSHO must provide and maintain the APP and a log of signatures by each subcontractor foreman, attesting that they have read and understand the APP, and make the APP and log available on-site to the Contracting Officer. If English is not the foreman's primary language, the Prime Contractor must provide an interpreter.

Submit the APP to the Contracting Officer 15 calendar days prior to the date of the preconstruction conference for acceptance. Work cannot proceed without an accepted APP. Once reviewed and accepted by the Contracting Officer, the APP and attachments will be enforced as part of the Contract. Disregarding the provisions of this Contract or the accepted APP is cause for stopping of work, at the discretion of the Contracting Officer, until the matter has been rectified. Continuously review and amend the APP, as necessary, throughout the life of the Contract. Changes to the accepted APP must be made with the knowledge and concurrence of the Contracting Officer, project superintendent, SSHO and Quality Control Manager. Incorporate unusual or high-hazard activities not identified in the original APP as they are discovered. Should any severe hazard exposure (i.e. imminent danger) become evident, stop work in the area, secure the area, and develop a plan to remove the exposure and control the hazard. Notify the Contracting Officer within 24 hours of discovery. Eliminate and remove the hazard. In the interim, take all necessary action to restore and maintain safe working conditions in order to safeguard onsite personnel, visitors, the public (as defined by ASSP A10.34), and the environment.

### 1.7.2 Names and Qualifications

Provide plans in accordance with the requirements outlined in Appendix A of EM 385-1-1, including the following:

a. Names and qualifications (resumes including education, training, experience and certifications) of site safety and health personnel

designated to perform work on this project to include the designated Site Safety and Health Officer and other competent and qualified personnel to be used. Specify the duties of each position.

b. Qualifications of competent and of qualified persons. As a minimum, designate and submit qualifications of competent persons for each of the following major areas: excavation; scaffolding; fall protection; hazardous energy; confined space; health hazard recognition, evaluation and control of chemical, physical and biological agents; and personal protective equipment and clothing to include selection, use and maintenance.

1.7.3 Plans

Provide plans in the APP in accordance with the requirements outlined in Appendix A of EM 385-1-1, including the following:

1.7.3.1 Confined Space Entry Plan

Develop a confined or enclosed space entry plan in accordance with EM 385-1-1, applicable OSHA standards 29 CFR 1910, 29 CFR 1915, and 29 CFR 1926, OSHA Directive CPL 2.100, and any other federal, state and local regulatory requirements identified in this Contract. Identify the qualified person's name and qualifications, training, and experience. Delineate the qualified person's authority to direct work stoppage in the event of hazardous conditions. Include procedure for rescue by Contractor personnel and the coordination with emergency responders. (If there is no confined space work, include a statement that no confined space work exists and none will be created.)

1.7.3.2 Standard Lift Plan (SLP)

Plan lifts to avoid situations where the operator cannot maintain safe control of the lift. Prepare a written SLP in accordance with EM 385-1-1, Section 16.A.03, using Form 16-2 for every lift or series of lifts (if duty cycle or routine lifts are being performed). The SLP must be developed, reviewed and accepted by all personnel involved in the lift in conjunction with the associated AHA. Signature on the AHA constitutes acceptance of the plan. Maintain the SLP on the LHE for the current lift(s) being made. Maintain historical SLPs for a minimum of three months.

1.7.3.3 Critical Lift Plan - Crane or Load Handling Equipment

Provide a Critical Lift Plan as required by EM 385-1-1, Section 16.H.01, using Form 16-3. In addition, Critical Lift Plans are required for the following:

a. Lifts over 50 percent of the capacity of barge mounted mobile crane's hoist.

b. When working around energized power lines where the work will get closer than the minimum clearance distance in EM 385-1-1 Table 16-1.

c. For lifts with anticipated binding conditions.

d. When erecting cranes.

1.7.3.3.1 Critical Lift Plan Planning and Schedule

Critical lifts require detailed planning and additional or unusual safety precautions. Develop and submit a critical lift plan to the Contracting Officer 30 calendar days prior to critical lift. Comply with load testing requirements in accordance with EM 385-1-1, Section 16.F.03.

1.7.3.3.2 Lifts of Personnel

In addition to the requirements of EM 385-1-1, Section 16.H.02, for lifts of personnel, demonstrate compliance with the requirements of 29 CFR 1926.1400 and EM 385-1-1, Section 16.T.

1.7.3.4 Multi-Purpose Machines, Material Handling Equipment, and Construction Equipment Lift Plan

Multi-purpose machines, material handling equipment, and construction equipment used to lift loads that are suspended by rigging gear, require proof of authorization from the machine OEM that the machine is capable of making lifts of loads suspended by rigging equipment. Written approval from a qualified registered professional engineer, after a safety analysis is performed, is allowed in lieu of the OEM's approval. Demonstrate that the operator is properly trained and that the equipment is properly configured to make such lifts and is equipped with a load chart.

1.7.3.5 Fall Protection and Prevention (FP&P) Plan

The plan must be in accordance with the requirements of EM 385-1-1, Section 21.D and ASSP Z359.2, be site specific, and address all fall hazards in the work place and during different phases of construction. Address how to protect and prevent workers from falling to lower levels when they are exposed to fall hazards above 6 feet. A competent person or qualified person for fall protection must prepare and sign the plan documentation. Include fall protection and prevention systems, equipment and methods employed for every phase of work, roles and responsibilities, assisted rescue, self-rescue and evacuation procedures, training requirements, and monitoring methods. Review and revise, as necessary, the Fall Protection and Prevention Plan documentation as conditions change, but at a minimum every six months, for lengthy projects, reflecting any changes during the course of construction due to changes in personnel, equipment, systems or work habits. Keep and maintain the accepted Fall Protection and Prevention Plan documentation at the job site for the duration of the project. Include the Fall Protection and Prevention Plan documentation in the Accident Prevention Plan (APP).

1.7.3.6 Rescue and Evacuation Plan

Provide a Rescue and Evacuation Plan in accordance with EM 385-1-1 Section 21.N and ASSP Z359.2, and include in the FP&P Plan and as part of the APP. Include a detailed discussion of the following: methods of rescue; methods of self-rescue; equipment used; training requirement; specialized training for the rescuers; procedures for requesting rescue and medical assistance; and transportation routes to a medical facility.

1.7.3.7 Hazardous Energy Control Program (HECP)

Develop a HECP in accordance with EM 385-1-1 Section 12, 29 CFR 1910.147, 29 CFR 1910.333, 29 CFR 1915.89, ASSP Z244.1, and ASSP A10.44. Submit this HECP as part of the Accident Prevention Plan (APP). Conduct a

preparatory meeting and inspection with all effected personnel to coordinate all HECP activities. Document this meeting and inspection in accordance with EM 385-1-1, Section 12.A.02. Ensure that each employee is familiar with and complies with these procedures.

1.7.3.8 Excavation Plan

Identify the safety and health aspects of excavation, and provide and prepare the plan in accordance with EM 385-1-1, Section 25.A and Section 31 00 00 EARTHWORK.

1.8 ACTIVITY HAZARD ANALYSIS (AHA)

Before beginning each activity, task or Definable Feature of Work (DFOW) involving a type of work presenting hazards not experienced in previous project operations, or where a new work crew or subcontractor is to perform the work, the Contractor(s) performing that work activity must prepare an AHA. AHAs must be developed by the Prime Contractor, subcontractor, or supplier performing the work, and provided for Prime Contractor review and approval before submitting to the Contracting Officer. AHAs must be signed by the SSHO, Superintendent, QC Manager and the subcontractor Foreman performing the work. Format the AHA in accordance with EM 385-1-1, Section 1 or as directed by the Contracting Officer. Submit the AHA for review at least 15 working days prior to the start of each activity task, or DFOW. The Government reserves the right to require the Contractor to revise and resubmit the AHA if it fails to effectively identify the work sequences, specific anticipated hazards, site conditions, equipment, materials, personnel and the control measures to be implemented.

AHAs must identify competent persons required for phases involving high risk activities, including confined entry, crane and rigging, excavations, trenching, electrical work, fall protection, and scaffolding.

1.8.1 AHA Management

Review the AHA list periodically (at least monthly) at the Contractor supervisory safety meeting, and update as necessary when procedures, scheduling, or hazards change. Use the AHA during daily inspections by the SSHO to ensure the implementation and effectiveness of the required safety and health controls for that work activity.

1.8.2 AHA Signature Log

Each employee performing work as part of an activity, task or DFOW must review the AHA for that work and sign a signature log specifically maintained for that AHA prior to starting work on that activity. The SSHO must maintain a signature log on site for every AHA. Provide employees whose primary language is other than English, with an interpreter to ensure a clear understanding of the AHA and its contents.

1.9 DISPLAY OF SAFETY INFORMATION

1.9.1 Safety Bulletin Board

Prior to commencement of work, erect a safety bulletin board at the job site. Where size, duration, or logistics of project do not facilitate a bulletin board, an alternative method, acceptable to the Contracting Officer, that is accessible and includes all mandatory information for

employee and visitor review, may be deemed as meeting the requirement for a bulletin board. Include and maintain information on safety bulletin board as required by EM 385-1-1, Section 01.A.07. Additional items required to be posted include:

a. Confined space entry permit.

b. Hot work permit.

1.9.2 Safety and Occupational Health (SOH) Deficiency Tracking System

Establish a SOH deficiency tracking system that lists and monitors the status of SOH deficiencies in chronological order. Use the tracking system to evaluate the effectiveness of the APP. A monthly evaluation of the data must be discussed in the QC or SOH meeting with everyone on the project. The list must be posted on the project bulletin board and updated daily, and provide the following information:

a. Date deficiency identified;

b. Description of deficiency;

c. Name of person responsible for correcting deficiency;

d. Projected resolution date;

e. Date actually resolved.

1.10 SITE SAFETY REFERENCE MATERIALS

Maintain safety-related references applicable to the project, including those listed in paragraph REFERENCES. Maintain applicable equipment manufacturer's manuals.

1.11 EMERGENCY MEDICAL TREATMENT

Contractors must arrange for their own emergency medical treatment in accordance with EM 385-1-1. Government has no responsibility to provide emergency medical treatment.

1.12 NOTIFICATIONS and REPORTS

1.12.1 Mishap Notification

Notify the Contracting Officer as soon as practical, but no more than twenty-four hours, after any mishaps, including recordable accidents, incidents, and near misses, as defined in EM 385-1-1 Appendix Q, any report of injury, illness, or any property damage. For LHE or rigging mishaps, notify the Contracting Officer as soon as practical but not more than four hours after mishap. The Contractor is responsible for obtaining appropriate medical and emergency assistance and for notifying fire, law enforcement, and regulatory agencies. Immediate reporting is required for electrical mishaps, to include Arc Flash; shock; uncontrolled release of hazardous energy (includes electrical and non-electrical); load handling equipment or rigging; fall from height (any level other than same surface); and underwater diving. These mishaps must be investigated in depth to identify all causes and to recommend hazard control measures.

Within notification include Contractor name; Contractt title; type of

Contract; name of activity, installation or location where accident occurred; date and time of accident; names of personnel injured; extent of property damage, if any; extent of injury, if known, and brief description of accident (for example, type of construction equipment used and PPE used). Preserve the conditions and evidence on the accident site until the Government investigation team arrives on-site and Government investigation is conducted. Assist and cooperate fully with the Government's investigation(s) of any mishap.

1.12.2 Accident Reports

a. Conduct an accident investigation for recordable injuries and illnesses, property damage, and near misses as defined in EM 385-1-1, to establish the root cause(s) of the accident. Complete the applicable USACE Accident Report ENG Form 3394, and provide the report to the Contracting Officer within 5 calendar days of the accident. The Contracting Officer will provide copies of any required or special forms.

b. Near Misses: For Army projects, report all "Near Misses" to the GDA, using local mishap reporting procedures, within 24 hrs. The Contracting Officer will provide the Contractor the required forms. Near miss reports are considered positive and proactive Contractor safety management actions.

c. Conduct an accident investigation for any load handling equipment accident (including rigging accidents) to establish the root cause(s) of the accident. Complete the LHE Accident Report (Crane and Rigging Accident Report) form and provide the report to the Contracting Officer within 30 calendar days of the accident. Do not proceed with crane operations until cause is determined and corrective actions have been implemented to the satisfaction of the Contracting Officer. The Contracting Officer will provide a blank copy of the accident report form.

1.12.3 LHE Inspection Reports

Submit LHE inspection reports required in accordance with EM 385-1-1 and as specified herein with Daily Reports of Inspections.

1.12.4 Certificate of Compliance and Pre-lift Plan/Checklist for LHE and Rigging

Provide a FORM 16-1 Certificate of Compliance for LHE entering an activity under this Contract and in accordance with EM 385-1-1. Post certifications on the crane.

Develop a Standard Lift Plan (SLP) in accordance with EM 385-1-1, Section 16.H.03 using Form 16-2 Standard Pre-Lift Crane Plan/Checklist for each lift planned. Submit SLP to the Contracting Officer for approval within 15 calendar days in advance of planned lift.

1.13 HOT WORK

1.13.1 Permit and Personnel Requirements

Submit and obtain a written permit prior to performing "Hot Work" (i.e. welding or cutting) or operating other flame-producing/spark producing

devices, from the Contracting Officer's representative. A permit is required from the Explosives Safety Office for work in and around where explosives are processed, stored, or handled. CONTRACTORS ARE REQUIRED TO MEET ALL CRITERIA BEFORE A PERMIT IS ISSUED. Provide at least two 20 pound 4A:20 BC rated extinguishers for normal "Hot Work". The extinguishers must be current inspection tagged, and contain an approved safety pin and tamper resistant seal. It is also mandatory to have a designated FIRE WATCH for any "Hot Work" done at this activity. The Fire Watch must be trained in accordance with NFPA 51B and remain on-site for a minimum of one hour after completion of the task or as specified on the hot work permit.

When starting work in the facility, require personnel to familiarize themselves with the location of the nearest fire alarm boxes and knowledge of emergency response plan and emergency phone numbers/contacts. REPORT ANY FIRE, NO MATTER HOW SMALL, TO THE RESPONSIBLE FIRE DEPARTMENT OR CONTRACTING OFFICER IMMEDIATELY.

### 1.13.2 Work Around Flammable Materials

Obtain permit approval from a NFPA Certified Marine Chemist for "HOT WORK" within or around flammable materials (such as fuel systems or welding/cutting on fuel pipes) or confined spaces (such as sewer wet wells, manholes, or vaults) that have the potential for flammable or explosive atmospheres.

Whenever these materials, except beryllium and chromium (VI), are encountered in indoor operations, local mechanical exhaust ventilation systems that are sufficient to reduce and maintain personal exposures to within acceptable limits must be used and maintained in accordance with manufacturer's instruction and supplemented by exceptions noted in EM 385-1-1, Section 06.H

## 1.14 RADIATION SAFETY REQUIREMENTS

Submit License Certificates, employee training records, and Leak Test Reports for radiation materials and equipment to the Contracting Officer and Radiation Safety Office (RSO) for all specialized and licensed material and equipment proposed for use on the construction project (excludes portable machine sources of ionizing radiation including moisture density and X-Ray Fluorescence (XRF)). Maintain on-site records whenever licensed radiological materials or ionizing equipment are on Government property.

Protect workers from radiation exposure in accordance with 10 CFR 20, ensuring any personnel exposures are maintained As Low As Reasonably Achievable.

## 1.15 CONFINED SPACE ENTRY REQUIREMENTS

Confined space entry must comply with Section 34 of EM 385-1-1, OSHA 29 CFR 1926, OSHA 29 CFR 1910, OSHA 29 CFR 1910.146, and OSHA Directive CPL 2.100. Any potential for a hazard in the confined space requires a permit system to be used.

### 1.15.1 Entry Procedures

Prohibit entry into a confined space by personnel for any purpose, including hot work, until the qualified person has conducted appropriate

tests to ensure the confined or enclosed space is safe for the work intended and that all potential hazards are controlled or eliminated and documented. Comply with EM 385-1-1, Section 34 for entry procedures. Hazards pertaining to the space must be reviewed with each employee during review of the AHA.

1.15.2 Forced Air Ventilation

Forced air ventilation is required for all confined space entry operations and the minimum air exchange requirements must be maintained to ensure exposure to any hazardous atmosphere is kept below its action level.

1.15.3 Sewer Wet Wells

Sewer wet wells require continuous atmosphere monitoring with audible alarm for toxic gas detection.

1.15.4 Rescue Procedures and Coordination with Local Emergency Responders

Develop and implement an on-site rescue and recovery plan and procedures. The rescue plan must not rely on local emergency responders for rescue from a confined space.

1.16 SEVERE STORM PLAN

In the event of a severe storm warning, the Contractor must comply with the applicable Storm Plan and:

a. Secure outside equipment and materials and place materials that could be damaged in protected areas.

b. Check surrounding area, including roof, for loose material, equipment, debris, and other objects that could be blown away or against existing facilities.

c. Ensure that temporary erosion controls are adequate.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.1 CONSTRUCTION AND OTHER WORK

Comply with EM 385-1-1, NFPA 70, NFPA 70E, NFPA 241, the APP, the AHA, Federal and State OSHA regulations, and other related submittals and activity fire and safety regulations. The most stringent standard prevails.

PPE is governed in all areas by the nature of the work the employee is performing. Use personal hearing protection at all times in designated noise hazardous areas or when performing noise hazardous tasks. Safety glasses must be worn or carried/available on each person. Mandatory PPE includes:

a. Hard Hat

b. Long Pants

c. Appropriate Safety Shoes

d. Appropriate Class Reflective Vests

3.1.1 Worksite Communication

Employees working alone in a remote location or away from other workers must be provided an effective means of emergency communications (i.e., cellular phone, two-way radios, land-line telephones or other acceptable means). The selected communication must be readily available (easily within the immediate reach) of the employee and must be tested prior to the start of work to verify that it effectively operates in the area/environment. Develop an employee check-in/check-out communication procedure to ensure employee safety.

3.1.2 Hazardous Material Exclusions

Notwithstanding any other hazardous material used in this Contract, radioactive materials or instruments capable of producing ionizing/non-ionizing radiation (with the exception of radioactive material and devices used in accordance with EM 385-1-1 such as nuclear density meters for compaction testing and laboratory equipment with radioactive sources) as well as materials which contain asbestos, mercury or polychlorinated biphenyls, di-isocyanates, lead-based paint, and hexavalent chromium, are prohibited. The Contracting Officer, upon written request by the Contractor, may consider exceptions to the use of any of the above excluded materials. Low mercury lamps used within fluorescent lighting fixtures are allowed as an exception without further Contracting Officer approval. Notify the Radiation Safety Officer (RSO) prior to excepted items of radioactive material and devices being brought on base.

3.1.3 Unforeseen Hazardous Material

Contract documents identify materials such as PCB, lead paint, and friable and non-friable asbestos and other OSHA regulated chemicals (i.e. 29 CFR 1910.1000). If material(s) that may be hazardous to human health upon disturbance are encountered during construction operations, stop that portion of work, notify the Contracting Officer immediately and determine if the material is hazardous. If material is not hazardous or poses no danger, the Government will direct the Contractor to proceed without change. If material is hazardous and handling of the material is necessary to accomplish the work, the Government will issue a modification pursuant to FAR 52.243-4 Changes and FAR 52.236-2 Differing Site Conditions.

3.2 UTILITY OUTAGE REQUIREMENTS

Apply for utility outages per Section 01 30 00.24 OTHER ADMINISTRATIVE AND SPECIAL REQUIREMENTS. At a minimum, the written request must include the location of the outage, utilities being affected, duration of outage, any necessary sketches, and a description of the means to fulfill energy isolation requirements in accordance with EM 385-1-1, Section 11.A.02 (Isolation). Some examples of energy isolation devices and procedures are highlighted in EM 385-1-1, Section 12.D. In accordance with EM 385-1-1, Section 12.A.01, where outages involve Government or Utility personnel, coordinate with the Government on all activities involving the control of hazardous energy.

These activities include, but are not limited to, a review of HECP and HEC procedures, as well as applicable Activity Hazard Analyses (AHAs). In accordance with EM 385-1-1, Section 11.A.02 and NFPA 70E, work on energized electrical circuits must not be performed without prior Government authorization. Government permission is considered through the permit process and submission of a detailed AHA. Energized work permits are considered only when de-energizing introduces additional or increased hazard or when de-energizing is infeasible.

## 3.3 OUTAGE COORDINATION MEETING

After the utility outage request is approved and prior to beginning work on the utility system requiring shut-down, conduct a pre-outage coordination meeting in accordance with EM 385-1-1, Section 12.A. This meeting must include the Prime Contractor, the Prime and subcontractors performing the work, the Contracting Officer, and the Installation representative. All parties must fully coordinate HEC activities with one another. During the coordination meeting, all parties must discuss and coordinate on the scope of work, HEC procedures (specifically, the lock-out/tag-out procedures for worker and utility protection), the AHA, assurance of trade personnel qualifications, identification of competent persons, and compliance with HECP training in accordance with EM 385-1-1, Section 12.C. Clarify when personal protective equipment is required during switching operations, inspection, and verification.

## 3.4 CONTROL OF HAZARDOUS ENERGY (LOCKOUT/TAGOUT)

Provide and operate a Hazardous Energy Control Program (HECP) in accordance with EM 385-1-1 Section 12, 29 CFR 1910.333, 29 CFR 1915.89, ASSP A10.44, NFPA 70E, and paragraph HAZARDOUS ENERGY CONTROL PROGRAM (HECP).

### 3.4.1 Safety Preparatory Inspection Coordination Meeting with the Government or Utility

For electrical distribution equipment that is to be operated by Government or Utility personnel, the Prime Contractor and the subcontractor performing the work must attend the safety preparatory inspection coordination meeting, which will also be attended by the Contracting Officer's Representative, and required by EM 385-1-1, Section 12.A.02. The meeting will occur immediately preceding the start of work and following the completion of the outage coordination meeting. Both the safety preparatory inspection coordination meeting and the outage coordination meeting must occur prior to conducting the outage and commencing with lockout/tagout procedures.

### 3.4.2 Lockout/Tagout Isolation

Where the Government or Utility performs equipment isolation and lockout/tagout, the Contractor must place their own locks and tags on each energy-isolating device and proceed in accordance with the HECP. Before any work begins, both the Contractor and the Government or Utility must perform energy isolation verification testing while wearing required PPE detailed in the Contractor's AHA and required by EM 385-1-1, Sections 05.I and 11.B. Install personal protective grounds, with tags, to eliminate the potential for induced voltage in accordance with EM 385-1-1, Section 12.E.06.

### 3.4.3 Lockout/Tagout Removal

Upon completion of work, conduct lockout/tagout removal procedure in accordance with the HECP. In accordance with EM 385-1-1, Section 12.E.08, each lock and tag must be removed from each energy isolating device by the authorized individual or systems operator who applied the device. Provide formal notification to the Government (by completing the Government form if provided by Contracting Officer's Representative), confirming that steps of de-energization and lockout/tagout removal procedure have been conducted and certified through inspection and verification. Government or Utility locks and tags used to support the Contractor's work will not be removed until the authorized Government employee receives the formal notification.

## 3.5 FALL PROTECTION PROGRAM

Establish a fall protection program, for the protection of all employees exposed to fall hazards. Within the program include company policy, identify roles and responsibilities, education and training requirements, fall hazard identification, prevention and control measures, inspection, storage, care and maintenance of fall protection equipment and rescue and evacuation procedures in accordance with ASSP Z359.2 and EM 385-1-1, Sections 21.A and 21.D.

### 3.5.1 Training

Institute a fall protection training program. As part of the Fall Protection Program, provide training for each employee who might be exposed to fall hazards and using personal fall protection equipment. Provide training by a competent person for fall protection in accordance with EM 385-1-1, Section 21.C. Document training and practical application of the competent person in accordance with EM 385-1-1, Section 21.C.04 and ASSP Z359.2 in the AHA.

### 3.5.2 Fall Protection Equipment and Systems

Enforce use of personal fall protection equipment and systems designated (to include fall arrest, restraint, and positioning) for each specific work activity in the Site Specific Fall Protection and Prevention Plan and AHA at all times when an employee is exposed to a fall hazard. Protect employees from fall hazards as specified in EM 385-1-1, Section 21.

Provide personal fall protection equipment, systems, subsystems, and components that comply with EM 385-1-1 Section 21.I, 29 CFR 1926.500 Subpart M,ASSP Z359.0, ASSP Z359.1, ASSP Z359.2, ASSP Z359.3, ASSP Z359.4, ASSP Z359.6, ASSP Z359.7, ASSP Z359.11, ASSP Z359.12, ASSP Z359.13, ASSP Z359.14, ASSP Z359.15, ASSP Z359.16 and ASSP Z359.18.

#### 3.5.2.1 Additional Personal Fall Protection Measures

In addition to the required fall protection systems, other protective measures such as safety skiffs, personal floatation devices, and life rings, are required when working above or next to water in accordance with EM 385-1-1, Sections 21.O through 21.O.06. Personal fall protection systems and equipment are required when working from an articulating or extendible boom, swing stages, or suspended platform. In addition, personal fall protection systems are required when operating other equipment such as scissor lifts. The need for tying-off in such equipment is to prevent ejection of the employee from the equipment during raising,

lowering, travel, or while performing work.

3.5.2.2 Personal Fall Protection Equipment

Only a full-body harness with a shock-absorbing lanyard or self-retracting lanyard is an acceptable personal fall arrest body support device. The use of body belts is not acceptable. Harnesses must have a fall arrest attachment affixed to the body support (usually a Dorsal D-ring) and specifically designated for attachment to the rest of the system. Snap hooks and carabineers must be self-closing and self-locking, capable of being opened only by at least two consecutive deliberate actions and have a minimum gate strength of 3,600 lbs in all directions. Use webbing, straps, and ropes made of synthetic fiber. The maximum free fall distance when using fall arrest equipment must not exceed 6 feet, unless the proper energy absorbing lanyard is used. Always take into consideration the total fall distance and any swinging of the worker (pendulum-like motion), that can occur during a fall, when attaching a person to a fall arrest system. Equip all full body harnesses with Suspension Trauma Preventers such as stirrups, relief steps, or similar in order to provide short-term relief from the effects of orthostatic intolerance in accordance with EM 385-1-1, Section 21.I.06.

3.5.3 Fall Protection for Roofing Work

Implement fall protection controls based on the type of roof being constructed and work being performed. Evaluate the roof area to be accessed for its structural integrity including weight-bearing capabilities for the projected loading.

a. Low Sloped Roofs:

(1) For work within 6 feet from unprotected edge of a roof having a slope less than or equal to 4:12 (vertical to horizontal), protect personnel from falling by the use of conventional fall protection systems (personal fall arrest/restraint systems, guardrails, or safety nets) in accordance with EM 385-1-1, Section 21 and 29 CFR 1926.500. A safety monitoring system is not adequate fall protection and is not authorized.

(2) For work greater than 6 feet from the unprotected roof edge, addition to the use of conventional fall protection systems the use of a warning line system is also permitted, in accordance with 29 CFR 1926.500 and EM 385-1-1, Section 21.L.

b. Steep-Sloped Roofs: Work on a roof having a slope greater than 4:12 (vertical to horizontal) requires a personal fall arrest system, guardrails with toe-boards, or safety nets. This requirement also applies to residential or housing type construction.

3.5.4 Horizontal Lifelines (HLL)

Provide HLL in accordance with EM 385-1-1, Section 21.I.08.d.2. Commercially manufactured horizontal lifelines (HLL) must be designed, installed, certified and used, under the supervision of a qualified person, for fall protection as part of a complete fall arrest system which maintains a safety factor of 2 (29 CFR 1926.500). The competent person for fall protection may (if deemed appropriate by the qualified person) supervise the assembly, disassembly, use and inspection of the HLL system under the direction of the qualified person. Locally manufactured HLLs

are not acceptable unless they are custom designed for limited or site specific applications by a Registered Professional Engineer who is qualified in designing HLL systems.

3.5.5 Guardrails and Safety Nets

Design, install and use guardrails and safety nets in accordance with EM 385-1-1, Section 21.F.01 and 29 CFR 1926 Subpart M.

3.5.6 Rescue and Evacuation Plan and Procedures

When personal fall arrest systems are used, ensure that the mishap victim can self-rescue or can be rescued promptly should a fall occur. Prepare a Rescue and Evacuation Plan and include a detailed discussion of the following: methods of rescue; methods of self-rescue or assisted-rescue; equipment used; training requirement; specialized training for the rescuers; procedures for requesting rescue and medical assistance; and transportation routes to a medical facility. Include the Rescue and Evacuation Plan within the Activity Hazard Analysis (AHA) for the phase of work, in the Fall Protection and Prevention (FP&P) Plan, and the Accident Prevention Plan (APP). The plan must be in accordance with the requirements of EM 385-1-1, ASSP Z359.2, and ASSP Z359.4.

3.6 WORK PLATFORMS

3.6.1 Scaffolding

Provide employees with a safe means of access to the work area on the scaffold. Climbing of any scaffold braces or supports not specifically designed for access is prohibited. Comply with the following requirements:

a. Scaffold platforms greater than 20 feet in height must be accessed by use of a scaffold stair system.

b. Ladders commonly provided by scaffold system manufacturers are prohibited for accessing scaffold platforms greater than 20 feet maximum in height.

c. An adequate gate is required.

d. Employees performing scaffold erection and dismantling must be qualified.

e. Scaffold must be capable of supporting at least four times the maximum intended load, and provide appropriate fall protection as delineated in the accepted fall protection and prevention plan.

f. Stationary scaffolds must be attached to structural building components to safeguard against tipping forward or backward.

g. Special care must be given to ensure scaffold systems are not overloaded.

h. Side brackets used to extend scaffold platforms on self-supported scaffold systems for the storage of material are prohibited. The first tie-in must be at the height equal to 4 times the width of the smallest dimension of the scaffold base.

i. Scaffolding other than suspended types must bear on base plates upon

wood mudsills ( 2 in x 10 in x 8 in minimum) or other adequate firm foundation.

j. Scaffold or work platform erectors must have fall protection during the erection and dismantling of scaffolding or work platforms that are more than 6 feet.

k. Delineate fall protection requirements when working above 6 feet or above dangerous operations in the Fall Protection and Prevention (FP&P) Plan and Activity Hazard Analysis (AHA) for the phase of work.

3.6.2 Elevated Aerial Work Platforms (AWPs)

Workers must be anchored to the basket or bucket in accordance with manufacturer's specifications and instructions (anchoring to the boom may only be used when allowed by the manufacturer and permitted by the CP). Lanyards used must be sufficiently short to prohibit worker from climbing out of basket. The climbing of rails is prohibited. Lanyards with built-in shock absorbers are acceptable. Self-retracting devices are not acceptable. Tying off to an adjacent pole or structure is not permitted unless a safe device for 100 percent tie-off is used for the transfer.

Use of AWPs must be operated, inspected, and maintained as specified in the operating manual for the equipment and delineated in the AHA. Operators of AWPs must be designated as qualified operators by the Prime Contractor. Maintain proof of qualifications on site for review and include in the AHA.

3.7 EQUIPMENT

3.7.1 Material Handling Equipment (MHE)

a. Material handling equipment such as forklifts must not be modified with work platform attachments for supporting employees unless specifically delineated in the manufacturer's printed operating instructions. Material handling equipment fitted with personnel work platform attachments are prohibited from traveling or positioning while personnel are working on the platform.

b. The use of hooks on equipment for lifting of material must be in accordance with manufacturer's printed instructions. Material Handling Equipment Operators must be trained in accordance with OSHA 29 CFR 1910, Subpart N.

c. Operators of forklifts or power industrial trucks must be licensed in accordance with OSHA.

3.7.2 Load Handling Equipment (LHE)

The following requirements apply. In exception, these requirements do not apply to commercial truck mounted and articulating boom cranes used solely to deliver material and supplies (not prefabricated components, structural steel, or components of a systems-engineered metal building) where the lift consists of moving materials and supplies from a truck or trailer to the ground; to cranes installed on mechanics trucks that are used solely in the repair of shore-based equipment; to crane that enter the activity but are not used for lifting; nor to other machines not used to lift loads suspended by rigging equipment. However, LHE accidents occurring during such operations must be reported.

a. Equip cranes and derricks as specified in EM 385-1-1, Section 16.

b. Notify the Contracting Officer 15 working days in advance of any LHE entering the activity, in accordance with EM 385-1-1, Section 16.A.02, so that necessary quality assurance spot checks can be coordinated. Contractor's operator must remain with the crane during the spot check. Rigging gear must be in accordance with OSHA, ASME B30.9 Standards safety standards.

c. Comply with the LHE manufacturer's specifications and limitations for erection and operation of cranes and hoists used in support of the work. Perform erection under the supervision of a designated person (as defined in ASME B30.5). Perform all testing in accordance with the manufacturer's recommended procedures.

d. As applicable, comply with ASME B30.5 for mobile and locomotive cranes, ASME B30.22 for articulating boom cranes, ASME B30.3 for construction tower cranes, ASME B30.8 for floating cranes and floating derricks, ASME B30.9 for slings, ASME B30.20 for below the hook lifting devices and ASME B30.26 for rigging hardware.

e. As applicable, when operating in the vicinity of overhead transmission lines, operators and riggers must be alert to this special hazard and follow the requirements of EM 385-1-1 Section 11, and ASME B30.5 or ASME B30.22 as applicable.

f. Do not use crane suspended personnel work platforms (baskets) unless the Contractor proves that using any other access to the work location would provide a greater hazard to the workers or is impossible. Do not lift personnel with a line hoist or friction crane. Additionally, submit a specific AHA for this work to the Contracting Officer. Ensure the activity and AHA are thoroughly reviewed by all involved personnel.

g. Inspect, maintain, and recharge portable fire extinguishers as specified in NFPA 10, Standard for Portable Fire Extinguishers.

h. All employees must keep clear of loads about to be lifted and of suspended loads, except for employees required to handle the load.

i. Use cribbing when performing lifts on outriggers.

j. The crane hook/block must be positioned directly over the load. Side loading of the crane is prohibited.

k. A physical barricade must be positioned to prevent personnel access where accessible areas of the LHE's rotating superstructure poses a risk of striking, pinching or crushing personnel.

l. Maintain inspection records in accordance by EM 385-1-1, Section 16.D, including shift, monthly, and annual inspections, the signature of the person performing the inspection, and the serial number or other identifier of the LHE that was inspected. Records must be available for review by the Contracting Officer.

m. Maintain written reports of operational and load testing in accordance with EM 385-1-1, Section 16.F, listing the load test procedures used along with any repairs or alterations performed on the LHE. Reports

must be available for review by the Contracting Officer.

n. Certify that all LHE operators have been trained in proper use of all safety devices (e.g. anti-two block devices).

o. Take steps to ensure that wind speed does not contribute to loss of control of the load during lifting operations. At wind speeds greater than 20 mph, the operator, rigger and lift supervisor must cease all crane operations, evaluate conditions and determine if the lift may proceed. Base the determination to proceed or not on wind calculations per the manufacturer and a reduction in LHE rated capacity if applicable. Include this maximum wind speed determination as part of the activity hazard analysis plan for that operation.

q. Follow FAA guidelines when required based on project location.

3.7.3 Machinery and Mechanized Equipment

a. Proof of qualifications for operator must be kept on the project site for review.

b. Manufacture specifications or owner's manual for the equipment must be on-site and reviewed for additional safety precautions or requirements that are sometimes not identified by OSHA or USACE EM 385-1-1. Incorporate such additional safety precautions or requirements into the AHAs.

3.7.4 Base Mounted Drum Hoists

a. Operation of base mounted drum hoists must be in accordance with EM 385-1-1 and ASSP A10.22.

b. Rigging gear must be in accordance with applicable ASME/OSHA standards.

c. When used on telecommunication towers, base mounted drum hoists must be in accordance with TIA-1019, TIA-222, ASME B30.7, 29 CFR 1926.552, and 29 CFR 1926.553.

d. When used to hoist personnel, the AHA must include a written standard operating procedure. Operators must have a physical examination in accordance with EM 385-1-1 Section 16.B.05 and trained, at a minimum, in accordance with EM 385-1-1 Section 16.U and 16.T. The base mounted drum hoist must also comply with OSHA Instruction CPL 02-01-056 and ASME B30.23.

e. Material and personnel must not be hoisted simultaneously.

f. Personnel cage must be marked with the capacity (in number of persons) and load limit in pounds.

g. Construction equipment must not be used for hoisting material or personnel or with trolley/tag lines. Construction equipment may be used for towing and assisting with anchoring guy lines.

3.7.5 Use of Explosives

Explosives must not be used or brought to the project site without prior written approval from the Contracting Officer. Such approval does not relieve the Contractor of responsibility for injury to persons or for

damage to property due to blasting operations.

Storage of explosives, when permitted on Government property, must be only where directed and in approved storage facilities. These facilities must be kept locked at all times except for inspection, delivery, and withdrawal of explosives.

## 3.8 EXCAVATIONS

Soil classification must be performed by a competent person in accordance with 29 CFR 1926 and EM 385-1-1.

### 3.8.1 Utility Locations

Provide a third party, independent, private utility locating company to positively identify underground utilities in the work area.

### 3.8.2 Utility Location Verification

Physically verify all underground utility locations, including utility depth, by potholing using water, air with non-conductive ends and can include hand digging using wood or fiberglass handled tools when any adjacent construction work is expected to come within 3 feet of the underground system. The exceptions are low and medium voltage circuits (see instructions listed below).

#### 3.8.2.1 Low and Medium Voltage Circuits

The Contractor with the assistance of the Fort Carson Base Maintenance Electrical Contractor and the USACE Electrical Technical support members is responsible for determining Low Voltage (480 volts and less) and Medium Voltage Circuits within their areas of excavation.

De-energize the circuit for medium voltage cable or direct buried medium voltage cables prior to performing any construction activities within 3 feet of the circuit. These systems must be potholed using water, air with non-conductive ends to locate the cabling. If the circuit is reenergized while still exposed, a barrier with danger signs must be provided to limit the approach boundary to 10 feet. De-energize the circuit prior to reentering the 10 feet boundary.

When the excavation will expose and undermine a concrete encased duct bank, submit a concrete encased duct bank electrical support plan for government acceptance prior to undermining the duct bank.

Pothole low voltage circuits (480 volts and less) using water, air with non-conductive ends to locate the cabling and depth without de-energizing the circuit. Once excavation starts and work is within 3-feet (in all directions) of the cabling / duct bank, the electrical power must be de-energized.

When directional boring occurs within three feet of a low voltage or medium voltage circuit (conduit, direct buried, or duct bank), the circuit must be de-energized.

For Low Voltage (480 volts and less) and Medium Voltage Circuits, submit the Fort Carson Utility Outage Request (FC Reg 420-19) through the COR. (See paragraph PRE-OUTAGE COORDINATION MEETING) of this specification and

Section 01 30 00.24 OTHER ADMINISTRATIVE AND SPECIAL REQUIREMENTS for a copy of the FC Reg 420-19).

3.8.3 Utilities Within and Under Concrete, Bituminous Asphalt, and Other Impervious Surfaces

Utilities located within and under concrete slabs or pier structures, bridges, parking areas, and the like, are extremely difficult to identify. Whenever Contract work involves chipping, saw cutting, or core drilling through concrete, bituminous asphalt or other impervious surfaces, the existing utility location must be coordinated with station utility departments in addition to location and depth verification by a third party, independent, private locating company. The third party, independent, private locating company must locate utility depth by use of Ground Penetrating Radar (GPR), X-ray, bore scope, or ultrasound prior to the start of demolition and construction. Outages to isolate utility systems must be used in circumstances where utilities are unable to be positively identified. The use of historical drawings does not alleviate the Contractor from meeting this requirement.

3.9 ELECTRICAL

Perform electrical work in accordance with EM 385-1-1, Sections 11 and 12.

3.9.1 Conduct of Electrical Work

As delineated in EM 385-1-1, electrical work is to be conducted in a de-energized state unless there is no alternative method for accomplishing the work. In those cases obtain an energized work permit from the Contracting Officer. The energized work permit application must be accompanied by the AHA and a summary of why the equipment/circuit needs to be worked energized. Underground electrical spaces must be certified safe for entry before entering to conduct work. Cables that will be cut must be positively identified and de-energized prior to performing each cut. Attach temporary grounds in accordance with ASTM F855 and IEEE 1048. Perform all high voltage cable cutting remotely using hydraulic cutting tool. When racking in or live switching of circuit breakers, no additional person other than the switch operator is allowed in the space during the actual operation. Plan so that work near energized parts is minimized to the fullest extent possible. Use of electrical outages clear of any energized electrical sources is the preferred method.

When working in energized substations, only qualified electrical workers are permitted to enter. When work requires work near energized circuits as defined by NFPA 70, high voltage personnel must use personal protective equipment that includes, as a minimum, electrical hard hat, safety shoes, insulating gloves and electrical arc flash protection for personnel as required by NFPA 70E. Insulating blankets, hearing protection, and switching suits may also be required, depending on the specific job and as delineated in the Contractor's AHA. Ensure that each employee is familiar with and complies with these procedures and 29 CFR 1910.147.

3.9.2 Qualifications

Electrical work must be performed by QP with verifiable credentials who are familiar with applicable code requirements. Verifiable credentials consist of State, National and Local Certifications or Licenses that a Master or Journeyman Electrician may hold, depending on work being performed, and must be identified in the appropriate AHA.

Journeyman/Apprentice ratio must be in accordance with State, Local requirements applicable to where work is being performed.

3.9.3 Arc Flash

Conduct a hazard analysis/arc flash hazard analysis whenever work on or near energized parts greater than 50 volts is necessary, in accordance with NFPA 70E.

All personnel entering the identified arc flash protection boundary must be QPs and properly trained in NFPA 70E requirements and procedures. Unless permitted by NFPA 70E, no Unqualified Person is permitted to approach nearer than the Limited Approach Boundary of energized conductors and circuit parts. Training must be administered by an electrically qualified source and documented.

3.9.4 Grounding

Ground electrical circuits, equipment and enclosures in accordance with NFPA 70 and IEEE C2 to provide a permanent, continuous and effective path to ground unless otherwise noted by EM 385-1-1.

Check grounding circuits to ensure that the circuit between the ground and a grounded power conductor has a resistance low enough to permit sufficient current flow to allow the fuse or circuit breaker to interrupt the current.

3.9.5 Testing

Temporary electrical distribution systems and devices must be inspected, tested and found acceptable for Ground-Fault Circuit Interrupter (GFCI) protection, polarity, ground continuity, and ground resistance before initial use, before use after modification and at least monthly. Monthly inspections and tests must be maintained for each temporary electrical distribution system, and signed by the electrical CP or QP.

3.10 AIRFIELD SAFETY PRECAUTIONS (DEC 1991)

3.10.1 Definitions

As used in this clause-

a. "Landing areas" means:

(1) The primary surfaces, comprising the surface of the runway, runway shoulders, and lateral safety zones. The length of each primary surface is the same as the runway length. The width of each primary surface is 2,000 feet (1,000 feet on each side of the runway centerline);

(2) The "clear zone" beyond the ends of each runway, i.e., the extension of the primary surface for a distance of 1,000 feet beyond each end of each runway.

(3) All taxiways, plus the lateral clearance zones along each side for the length of the taxiways (the outer edge of each lateral clearance zone is laterally 250 feet from the far or opposite edge of the taxiway, e.g., a 75-foot-wide taxiway would have a combined width of taxiway and lateral clearance zones of 425 feet); and

(4) All aircraft parking aprons, plus the area 125 feet in width extending beyond each edge all around the aprons.

b. "Safety precaution areas" means those portions of approach-departure clearance zones and transitional zones where placement of objects incident to contract performance might result in vertical projections at or above the approach-departure clearance, or the transitional surface.

(1) The "approach-departure clearance surface" is an extension of the primary surface and the clear zone at each end of each runway, for a distance of 50,000 feet, first along an inclined (glide angle) and then along a horizontal plane, both flaring symmetrically about the runway centerline extended.

(a) The inclined plane (glide angle) begins in the clear zone 200 feet past the end of the runway (and primary surface) at the same elevation as the end of the runway. It continues upward at a slope of 50:1 (1 foot vertically for each 50 feet horizontally) to an elevation of 500 feet above the established airfield elevation. At that point the plane become horizontal, continuing at that same uniform elevation to a point 50,000 feet longitudinally from the beginning of the inclined plane (glide angle) and ending there.

(b) The width of the surface at the beginning of the inclined plane (glide angle) is the same as the width of the clear zone. It then flares uniformly, reaching the maximum width of 16,000 feet at the end.

(2) The "approach-departure clearance zone" is the ground area under the approach-departure clearance surface.

(3) The "transitional surface" is a sideways extension of all primary surfaces, clear zones, and approach-departure clearance surfaces along inclined planes.

(a) The inclined plane in each case begins at the edge of the surface.

(b) The slope of the incline plane is 7:1 (1 foot vertically for each 7 feet horizontally). It continues to the point of intersection with the-

(i) Inner horizontal surface (which is the horizontal plane 500 feet above the established airfield elevation); or

(ii) Outer horizontal surface (which is the horizontal plane 500 feet above the established airfield elevation), whichever is applicable.

(4) The "transitional zone" is the ground area under the transitional surface. (It adjoins the primary surface, clear zone, and approach-departure clearance zone.)

3.10.2 General

a. The Contractor shall comply with the requirements of this clause while-

(1) Operating all ground equipment (mobile or stationary);

(2) Placing all materials; and

(3) Performing all work, upon and around all airfields.

b. The requirements of this clause are in addition to any other safety requirements of this contract.

3.10.3 Contractor Reporting, Notifications, and Operations Requirements

The Contractor shall:

a. Report to the Contracting Officer before initiating any work;

b. Notify the Contracting Officer of proposed changes to locations and operations;

c. Not permit either its equipment or personnel to use any runway for purposes other than aircraft operation without permission of the Contracting Officer, unless the runway is-

(1) Closed by order of the Contracting Officer; and

(2) Marked as provided in paragraph 3.10.4 b. of this clause;

d. Keep all paved surfaces, such as runways, taxiways, and hardstands, clean at all times and, specifically, free from small stones which might damage aircraft propellers or jet aircraft;

e. Operate mobile equipment according to the safety provisions of this clause, while actually performing work on the airfield. At all other times, the Contractor shall remove all mobile equipment to locations-

(1) Approved by the Contracting Officer;

(2) At a distance of at least 750 feet from the runway centerline, plus any additional distance, and

(3) Necessary to ensure compliance with the other provisions of this clause; and

f. Not open a trench unless material is on hand and ready for placing in the trench. As soon as practicable after material has been placed and work approved, the Contractor shall backfill and compact trenches as required by the contract. Meanwhile, all hazardous conditions shall be marked and lighted in accordance with the other provisions of this clause.

3.10.4 Landing Areas

The Contractor shall:

a. Place nothing upon the landing areas without the authorization of the Contracting Officer;

b. Outline those landing areas hazardous to aircraft, using (unless otherwise authorized by the Contracting Officer) red flags by day, and

electric, battery-operated low-intensity red flasher lights by night;

c. Obtain, at an airfield where flying is controlled, additional permission from the control tower operator every time before entering any land area, unless the landing area is marked as hazardous in accordance with paragraph 3.10.4 b. of this clause;

d. Identify all vehicles it operates in landing areas by means of a flag on a staff attached to, and flying above, the vehicle. The flag shall be three feet square, and consist of a checkered pattern of international orange and white squares of 1 foot on each side (except that the flag may vary up to ten percent from each of these dimensions);

e. Mark all other equipment and materials in the landing areas, using the same marking devices as in paragraph 3.10.4 b. of this clause; and

f. Perform work so as to leave that portion of the landing area which is available to aircraft free from hazards, holes, piles of material, and projecting shoulders that might damage an airplane tire.

3.10.5 Safety Precaution Areas

The Contractor shall:

a. Place nothing upon the safety precaution areas without authorization of the Contracting Officer.

b. Mark all equipment and materials in safety precaution areas, using (unless otherwise authorized by the Contracting Officer) red flags by day, and electric, battery-operated, low-intensity red flasher lights by night.

c. Provide all objects placed in safety precaution areas with a red light or red lantern at night, if the objects project above the approach-departure clearance surface or above the transitional surface. (DFARS 252.236-7005)

SECTION 01 41 26.05 24

(FEDERAL FACILITIES COLORADO) NPDES PERMIT REQUIREMENTS FOR STORM WATER DISCHARGES FROM CONSTRUCTION SITES
**05/21**

PART 1 GENERAL

"STORMWATER DISCHARGE ASSOCIATED WITH CONSTRUCTION ACTIVITIES ", Permit No. COR400000 can be found at the following website: https://cdphe.colorado.gov/cor400000-stormwater-discharge

1.1 REFERENCES (Not Applicable)

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only or as otherwise designated. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Inspector Qualifications

Name and qualifications of all personnel who will be performing inspections on the site.

PART 2 PRODUCTS (Not Applicable)

PART 3 EXECUTION

3.1 GENERAL

The Contractor shall be responsible for implementing the terms and requirements of the National Pollutant Discharge Elimination System General Permit for Discharges from Construction Activities (Permit No. COR400000, hereinafter called "the permit") as specified below. The Government and the Contractor shall be considered co-permittees. The Government has operational control over construction plans and specifications, including the ability to make modifications to those plans and specifications. The Contractor shall have day-to-day operational control of those activities which are necessary to ensure compliance with the requirements specified herein. The Contractor shall be responsible for all submissions to the EPA and shall retain the official copy of all documents pertaining to compliance with the permit during construction. The project site is not located in designated critical habitat and there are no known "listed species" located in the project area.

## 3.2 IMPLEMENTATION

### 3.2.1 Notice of Intent

The Contractor shall electronically complete and sign a Notice of Intent (NOI) in accordance with the Permit. The Contractor shall notify the Contracting Officer's Representative within 24 hours after submitting his NOI. The Contractor shall not submit his NOI to the EPA until his Storm Water Pollution Prevention Plan has been accepted by the Government. After completion of the electronic NOI, a 14-day waiting period begins. The EPA will give the Contractor authorization that his NOI is in effect after the 14-day waiting period. The Contractor may not begin land disturbance activities until authorized by the Contracting Officer.

### 3.2.2 Storm Water Pollution Prevention Plan

#### 3.2.2.1 General

The Contractor shall each prepare a Stormwater Pollution Prevention Plan (SWPPP) for the project. The SWPPP describes the Government's responsibilities as the permittee with operational control over construction plans and specifications. The SWPPP describe the Conntractor's responsibilities to include all other requirements described in the general permit. The Government will provide the Contractor with a SWPPP template to use if he chooses. The Contractor shall include appropriate controls and measures for any off-site support activities covered under the permit. The SWPPP shall describe the nature and location of the activity and a location map and site map shall be included in accordance with the permit. The Contractor shall be responsible for implementing, maintaining and updating the SWPPP (including Site Map) during construction. Unless otherwise indicated, the Contractor shall be responsible for implementing all measures described in the SWPPP. The Contractor shall maintain the following records and attach to the SWPPP: the dates when major grading activities occur; the dates when construction activities temporarily or permanently cease on a portion of the site; and the dates when stabilization measures are initiated. The SWPPP shall be signed by the Contractor and the Government. A copy of the written authorization shall be attached to the SWPPP for any person signing the SWPPP or Inspection Reports other than the person described in the permit. If major changes to the SWPPP are required during construction, the SWPPP shall be recertified by the Contractor. A copy of the approved SWPPP shall be furnished to Fort Carson DPW.

#### 3.2.2.2 Acceptance of SWPPP

Acceptance of the SWPPP is required prior to the start of construction. Acceptance is conditional and will be predicated on satisfactory performance during the construction. The Government reserves the right to require the Contractor to make changes to the SWPPP if the Contracting Officer determines that environmental protection requirements are not being met.

#### 3.2.2.3 Notification of Changes

After acceptance of the SWPPP, the Contractor shall notify the Contracting Officer in writing of any proposed change. Proposed changes are subject to acceptance by the Contracting Officer.

### 3.2.3 Posting Notice

The Contractor shall post copies of each of the NOI's electronically submitted to the EPA Storm Water Notice Processing Center. The NOI shall be posted conspicuously near the main entrance of the construction site.

### 3.2.4 Inspections and Reporting

The Contractor shall be responsible for all inspections required by the general permit. The Contractor shall also prepare and sign all reports summarizing the inspections as required by the general permit. Copies of inspection reports shall be attached to the Contractor's SWPPP and provided to the Contracting Officer's Representative within 24 hours after completion of each inspection. The Contractor shall notify the Contracting Officer within 24 hours if an inspection identifies any incidents of non-compliance with the SWPPP and the general permit.

#### 3.2.4.1 Inspector Qualifications

Contractor personnel performing inspections shall be knowledgeable in the principles and practice of erosion and sediment controls and possess the skills to assess conditions at the construction site that could impact storm water quality and to assess the effectiveness of any sediment and erosion control measures selected to control the quality of storm water discharges from the construction site. The Contractor shall submit the name and qualifications of all personnel who will be performing inspections on the site.

### 3.2.5 Maintenance

The Contractor shall be responsible for maintaining all erosion and sediment control measures and other protective measures identified in the SWPPP in an effective operating condition. The Government reserves the right to require the Contractor to perform maintenance on erosion and sediment control measures and other protective measures if the Contracting Officer determines that environmental protection requirements are not being met.

### 3.2.6 Notice of Termination

The Contractor shall establish a stand of grass in all disturbed areas of the project not otherwise surfaced and shall meet the requirements for "Final Stabilization" as defined in the permit prior to terminating permit coverage. The Contractor shall notify the Contracting Officer within 2 working days after final stabilization on all portions of the site has been achieved in accordance the permit. The Contractor shall electronically complete and sign a Notice of Termination (NOT) in accordance with the permit. A copy of the Contractor's NOT and the updated SWPPP shall be furnished to the Contracting Officer within 5 calendar days after final stabilization has been achieved on all portions of the site.

### 3.2.7 Retention of Records

After the Contractor submits his NOT, the Government shall be responsible for retaining copies of the SWPPP and all reports in accordance with the permit.

3.2.8 Continuation of Expired Permit

If the current permit expires prior to completion of construction, the Contractor shall comply with the conditions of the new permit.

SECTION 01 42 00

SOURCES FOR REFERENCE PUBLICATIONS
**11/14**

PART 1 GENERAL

1.1 REFERENCES

Various publications are referenced in other sections of the specifications to establish requirements for the work. These references are identified in each section by document number, date and title. The document number used in the citation is the number assigned by the standards producing organization (e.g. ASTM B564 Standard Specification for Nickel Alloy Forgings). However, when the standards producing organization has not assigned a number to a document, an identifying number has been assigned for reference purposes.

1.2 ORDERING INFORMATION

The addresses of the standards publishing organizations whose documents are referenced in other sections of these specifications are listed below, and if the source of the publications is different from the address of the sponsoring organization, that information is also provided.

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

| | |
|---|---|
| ASTM D3740 | (2019) Minimum Requirements for Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction |
| ASTM E329 | (2020) Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection |

1.2 PAYMENT

Separate payment will not be made for providing and maintaining an effective Quality Control program. Include all associated costs in the applicable Pricing Schedule item.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor Quality Control (CQC) Plan; G, RO

SD-06 Test Reports

Verification Statement

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.1 GENERAL REQUIREMENTS

Establish and maintain an effective quality control (QC) system that complies with the Contract Clause titled "Inspection of Construction." QC

consist of plans, procedures, and organization necessary to produce an end product which complies with the Contract requirements. The QC system covers all construction operations, both onsite and offsite, and be keyed to the proposed construction sequence. The project superintendent will be held responsible for the quality of work and is subject to removal by the Contracting Officer for non-compliance with the quality requirements specified in the Contract. In this context the highest level manager responsible for the overall construction activities at the site, including quality and production is the project superintendent. The project superintendent maintains a physical presence at the site at all times and is responsible for all construction and related activities at the site, except as otherwise acceptable to the Contracting Officer.

## 3.2 CONTRACTOR QUALITY CONTROL (CQC) PLAN

Submit no later than 15 calendar days after receipt of notice to proceed, the Contractor Quality Control (CQC) Plan proposed to implement the requirements of the Contract Clause titled "Inspection of Construction." The Government will consider an interim plan for the first 30 days of operation. Construction will be permitted to begin only after acceptance of the CQC Plan or acceptance of an interim plan applicable to the particular feature of work to be started. Work outside of the accepted interim plan will not be permitted to begin until acceptance of a CQC Plan or another interim plan containing the additional work.

### 3.2.1 Content of the CQC Plan

Include, as a minimum, the following to cover all construction-operations, both onsite and offsite, including work by subcontractors, fabricators, suppliers, and purchasing agents:

a. A description of the quality control organization, including a chart showing lines of authority and acknowledgment that the CQC staff will implement the three phase control system for all aspects of the work specified. Include a CQC System Manager that reports to the project superintendent.

b. The name, qualifications (in resume format), duties, responsibilities, and authorities of each person assigned a CQC function.

c. A copy of the letter to the CQC System Manager signed by an authorized official of the firm which describes the responsibilities and delegates sufficient authorities to adequately perform the functions of the CQC System Manager, including authority to stop work which is not in compliance with the Contract. Letters of direction to all other various quality control representatives outlining duties, authorities, and responsibilities will be issued by the CQC System Manager. Furnish copies of these letters to the Contracting Officer.

d. Procedures for scheduling, reviewing, certifying, and managing submittals, including those of subcontractors, offsite fabricators, suppliers, and purchasing agents. These procedures must be in accordance with Section 01 33 00 SUBMITTAL PROCEDURES.

e. Control, verification, and acceptance testing procedures for each specific test to include the test name, specification paragraph requiring test, feature of work to be tested, test frequency, and person responsible for each test. (Laboratory facilities approved by the Contracting Officer are required to be used.)

f. Procedures for tracking preparatory, initial, and follow-up control phases and control, verification, and acceptance tests including documentation.

g. Procedures for tracking construction deficiencies from identification through acceptable corrective action. Establish verification procedures that identified deficiencies have been corrected.

h. Reporting procedures, including proposed reporting formats.

i. A list of the definable features of work. A definable feature of work is a task which is separate and distinct from other tasks, has separate control requirements, and is identified by different trades or disciplines, or it is work by the same trade in a different environment. Although each section of the specifications can generally be considered as a definable feature of work, there are frequently more than one definable features under a particular section. This list will be agreed upon during the coordination meeting.

3.2.2 Acceptance of Plan

Acceptance of the Contractor's plan is required prior to the start of construction. Acceptance is conditional and will be predicated on satisfactory performance during theconstruction. The Government reserves the right to require the Contractor to make changes in the Contractor Quality Control(CQC) Plan and operations including removal of personnel, as necessary, to obtain the quality specified.

3.2.3 Notification of Changes

After acceptance of the CQC Plan, notify the Contracting Officer in writing of any proposed change. Proposed changes are subject to acceptance by the Contracting Officer.

3.3 COORDINATION MEETING

After the Preconstruction Conference, before start of construction, and prior to acceptance by the Government of the CQC Plan, meet with the Contracting Officer and discuss the Contractor's quality control system. Submit the CQC Plan a minimum of 10 calendar days prior to the Coordination Meeting. During the meeting, a mutual understanding of the system details must be developed, including the forms for recording the CQC operations, control activities, testing, administration of the system for both onsite and offsite work, and the interrelationship of Contractor's Management and control with the Government's Quality Assurance. Minutes of the meeting will be prepared by the Government, signed by both the Contractor and the Contracting Officer and will become a part of the contract file. There can be occasions when subsequent conferences will be called by either party to reconfirm mutual understandings and/or address deficiencies in the CQC system or procedures which can require corrective action by the Contractor.

3.4 QUALITY CONTROL ORGANIZATION

3.4.1 Personnel Requirements

The requirements for the CQC organization are a Safety and Health Manager,

CQC System Manager, and sufficient number of additional qualified personnel to ensure safety and Contract compliance. The Safety and Health Manager reports directly to a senior project (or corporate) official independent from the CQC System Manager. The Safety and Health Manager will also serve as a member of the CQC Staff Personnel identified in the technical provisions as requiring specialized skills to assure the required work is being performed properly will also be included as part of the CQC organization. The Contractor's CQC staff maintains a presence at the site at all times during progress of the work and have complete authority and responsibility to take any action necessary to ensure Contract compliance. The CQC staff will be subject to acceptance by the Contracting Officer. Provide adequate office space, filing systems and other resources as necessary to maintain an effective and fully functional CQC organization. Promptly complete and furnish all letters, material submittals, shop drawing submittals, schedules and all other project documentation to the CQC organization. The CQC organization is responsible to maintain these documents and records at the site at all times, except as otherwise acceptable to the Contracting Officer.

3.4.2 CQC System Manager

Identify as CQC System Manager an individual within the onsite work organization that is responsible for overall management of CQC and has the authority to act in all CQC matters for the Contractor. The CQC System Manager is required to be a construction person with a minimum of 5 years in related work. This CQC System Manager is on the site at all times during construction and is employed by the prime Contractor. The CQC System Manager is assigned no other duties. Identify in the plan an alternate to serve in the event of the CQC System Manager's absence. The requirements for the alternate are the same as the CQC System Manager.

3.4.3 CQC Personnel

Maintain a staff under the direction of the CQC system manager to perform all QC activities. The staff must be of sufficient size to ensure adequate QC coverage of all work phases, work shifts, and work crews involved in the construction. These personnel may perform other duties, but must be fully qualified by experience and technical training to perform their assigned QC responsibilities and must be allowed sufficient time to carry out these responsibilities. Clearly state the duties and responsibilities of each staff member in the QC Plan. Other technical specifications may specify individuals for maintaining quality control for specific areas of work.

3.4.4 Assignment of CQC System Manager, Project Superintendent, and SSHO Responsibilities

The CQC System Manager, Project Superintendent, and SSHO may not share duties and are required to be separate individuals.

3.4.5 Construction Quality Management Course

In addition to the above experience and education requirements, the Contractor Quality Control(CQC) System Manager and Alternate CQC System Manager are required to have completed the Construction Quality Management (CQM) for Contractors course.

Contractor personnel who otherwise fulfill all requirements for designation as a CQC Manager, but have not had the opportunity to obtain a CQM certificate due to COVID-19 restrictions, shall be permitted to serve as Quality Control Managers conditioned upon obtaining a CQM-C certificate within 120 days of USACE lifting current in person learning restrictions.

CQC Managers who were in possession of valid CQM certificate (i.e. not delinquent on the 5 year course renewal requirement) as of 01-Mar-2020 will have a grace period for obtaining the CQM renewal training of 6-months from the lifting of COVID-19 restrictions and USACE being able to provide face to face CQM training.

This course is periodically offered at offices indicated at the following web site:

http://www.nwo.usace.army.mil/BusinessWithUs/Contracting/QualityManagement.aspx

The exact date and location for the sessions will be determined approximately 30 calendar days in advance by the trainer (POC). Cost varies by location per student.

The Construction Quality Management Training certificate expires after 5 years. If the CQC System Manager's certificate has expired, retake the course to remain current.

The Government reserves the right to recognize certificates issued as a result of virtual training by a certified instructor as valid.

### 3.4.6 Organizational Changes

Maintain the CQC staff at full strength at all times. When it is necessary to make changes to the CQC staff, revise the CQC Plan to reflect the changes and submit the changes to the Contracting Officer for acceptance.

## 3.5 SUBMITTALS AND DELIVERABLES

Submittals, if needed, have to comply with the requirements in Section 01 33 00 SUBMITTAL PROCEDURES. The CQC organization is responsible for certifying that all submittals and deliverables are in compliance with the contract requirements. When Section 01 91 00.15 TOTAL BUILDING COMMISSIONING are included in the contract, the submittals required by those sections have to be coordinated with Section 01 33 00 SUBMITTAL PROCEDURES to ensure adequate time is allowed for each type of submittal required.

## 3.6 CONTROL

CQC is the means by which the Contractor ensures that the construction, to include that of subcontractors and suppliers, complies with the requirements of the contract. At least three phases of control are required to be conducted by the CQC System Manager for each definable feature of the construction work as follows:

### 3.6.1 Preparatory Phase

This phase is performed prior to beginning work on each definable feature of work, after all required plans/documents/materials are approved/accepted, and after copies are at the work site. This phase includes:

a. A review of each paragraph of applicable specifications, reference codes, and standards. Make available during the preparatory inspection a copy of those sections of referenced codes and standards applicable to that portion of the work to be accomplished in the field. Maintain and make available in the field for use by Government personnel until final acceptance of the work.

b. Review of the Contract drawings.

c. Check to assure that all materials and/or equipment have been tested, submitted, and approved.

d. Review of provisions that have been made to provide required control inspection and testing.

e. Examination of the work area to assure that all required preliminary work has been completed and is in compliance with the Contract.

f. Examination of required materials, equipment, and sample work to assure that they are on hand, conform to approved shop drawings or submitted data, and are properly stored.

g. Review of the appropriate activity hazard analysis to assure safety requirements are met.

h. Discussion of procedures for controlling quality of the work including repetitive deficiencies. Document construction tolerances and workmanship standards for that feature of work.

i. Check to ensure that the portion of the plan for the work to be performed has been accepted by the Contracting Officer.

j. Discussion of the initial control phase.

k. Schedule all preparatory inspections two(2) weeks in advance. Include a meeting conducted by the CQC System Manager and attended by the superintendent, other CQC personnel (as applicable), and the foreman responsible for the definable feature. Document the results of the preparatory phase actions by separate minutes prepared by the CQC System Manager and attach to the daily CQC report. Instruct applicable workers as to the acceptable level of workmanship required in order to meet contract specifications.

3.6.2 Initial Phase

This phase is accomplished at the beginning of a definable feature of work. Accomplish the following:

a. Check work to ensure that it is in full compliance with contract requirements. Review minutes of the preparatory meeting.

b. Verify adequacy of controls to ensure full contract compliance. Verify required control inspection and testing are in compliance with the contract.

c. Establish level of workmanship and verify that it meets minimum acceptable workmanship standards. Compare with required sample panels as appropriate.

d. Resolve all differences.

e. Check safety to include compliance with and upgrading of the safety plan and activity hazard analysis. Review the activity analysis with each worker.

f. The Government needs to be notified at least 48 hours in advance of beginning the initial phase for definable feature of work. Prepare separate minutes of this phase by the CQC System Manager and attach to the daily CQC report. Indicate the exact location of initial phase for definable feature of work for future reference and comparison with follow-up phases.

g. The initial phase for each definable feature of work is repeated for each new crew to work onsite, or any time acceptable specified quality standards are not being met.

3.6.3 Follow-up Phase

Perform daily checks to assure control activities, including control testing, are providing continued compliance with contract requirements, until completion of the particular feature of work. Record the checks in the CQC documentation. Conduct final follow-up checks and correct all deficiencies prior to the start of additional features of work which may be affected by the deficient work. Do not build upon nor conceal non-conforming work.

3.6.4 Additional Preparatory and Initial Phases

Conduct additional preparatory and initial phases on the same definable features of work if: the quality of on-going work is unacceptable; if there are changes in the applicable CQC staff, onsite production supervision or work crew; if work on a definable feature is resumed after a substantial period of inactivity; or if other problems develop.

3.7 TESTS

3.7.1 Testing Procedure

Perform specified or required tests to verify that control measures are adequate to provide a product which conforms to contract requirements. Upon request, furnish to the Government duplicate samples of test specimens for possible testing by the Government. Testing includes operation and/or acceptance tests when specified. Procure the services of a Corps of Engineers approved testing laboratory or establish an approved testing laboratory at the project site. Perform the following activities and record and provide the following data:

a. Verify that testing procedures comply with contract requirements.

b. Verify that facilities and testing equipment are available and comply with testing standards.

c. Check test instrument calibration data against certified standards.

d. Verify that recording forms and test identification control number system, including all of the test documentation requirements, have

been prepared.

e. Record results of all tests taken, both passing and failing on the CQC report for the date taken. Specification paragraph reference, location where tests were taken, and the sequential control number identifying the test. If approved by the Contracting Officer, actual test reports are submitted later with a reference to the test number and date taken. Provide an information copy of tests performed by an offsite or commercial test facility directly to the Contracting Officer. Failure to submit timely test reports as stated results in nonpayment for related work performed and disapproval of the test facility for this Contract.

3.7.2 Testing Laboratories

All testing laboratories must be validated by the USACE Material Testing Center (MTC) for the tests to be performed. Information on the USACE MTC with web-links to both a list of validated testing laboratories and for the laboratory inspection request for can be found at: https://mtc.erdc.dren.mil/

Click on "Lab Validation"
Search for a Validation

3.7.2.1 Capability Check

The Government reserves the right to check laboratory equipment in the proposed laboratory for compliance with the standards set forth in the contract specifications and to check the laboratory technician's testing procedures and techniques. Laboratories utilized for testing soils, concrete, asphalt, and steel is required to meet criteria detailed in ASTM D3740 and ASTM E329.

3.7.2.2 Capability Recheck

If the selected laboratory fails the capability check, the Contractor will be assessed the actual cost for the recheck to reimburse the Government for each succeeding recheck of the laboratory or the checking of a subsequently selected laboratory. Such costs will be deducted from the Contract amount due the Contractor.

3.7.3 Onsite Laboratory

The Government reserves the right to utilize the Contractor's control testing laboratory and equipment to make assurance tests, and to check the Contractor's testing procedures, techniques, and test results at no additional cost to the Government.

3.8 COMPLETION INSPECTION

3.8.1 Punch-Out Inspection

Conduct an inspection of the work by the CQC System Manager near the end of the work, or any increment of the work established by a time stated in the SUPPLEMENTARY CONDITIONS (SPECIAL CONTRACT REQUIREMENTS) Clause, "Commencement, Prosecution, and Completion of Work", or by the specifications. Prepare and include in the CQC documentation a punch list of items which do not conform to the approved drawings and specifications, as required by paragraph DOCUMENTATION. Include within the list of

deficiencies the estimated date by which the deficiencies will be corrected. Make a second inspection the CQC System Manager or staff to ascertain that all deficiencies have been corrected. Once this is accomplished, notify the Government that the facility is ready for the Government Pre-Final inspection.

3.8.2 Pre-Final Inspection

The Government will perform the pre-final inspection to verify that the facility is complete and ready to be occupied. A Government Pre-Final Punch List may be developed as a result of this inspection. Ensure that all items on this list have been corrected before notifying the Government, so that a Final inspection with the customer can be scheduled. Correct any items noted on the Pre-Final inspection in a timely manner. These inspections and any deficiency corrections required by this paragraph need to be accomplished within the time slated for completion of the entire work or any particular increment of the work if the project is divided into increments by separate completion dates.

3.8.3 Final Acceptance Inspection

The Contractor's Quality Control Inspection personnel, plus the superintendent or other primary management person, and the Contracting Officer's Representative is required to be in attendance at the final acceptance inspection. Additional Government personnel including, but not limited to, those from Base/Post Civil Facility Engineer user groups, and major commands can also be in attendance. The final acceptance inspection will be formally scheduled by the Contracting Officer based upon results of the Pre-Final inspection. Notify the Contracting Officer at least 14 days prior to the final acceptance inspection and include the Contractor's assurance that all specific items previously identified to the Contractor as being unacceptable, along with all remaining work performed under the Contract, will be complete and acceptable by the date scheduled for the final acceptance inspection. Failure of the Contractor to have all contract work acceptably complete for this inspection will be cause for the Contracting Officer to bill the Contractor for the Government's additional inspection cost in accordance with the Contract clause titled "Inspection of Construction".

3.9 DOCUMENTATION

Maintain current records providing factual evidence that required quality control activities and/or tests have been performed. Include in these records the work of subcontractors and suppliers on an acceptable form that includes, as a minimum, the following information:

a. The name and area of responsibility of the Contractor/Subcontractor.

b. Operating plant/equipment with hours worked, idle, or down for repair.

c. Work performed each day, giving location, description, and by whom. When Network Analysis (NAS) is used, identify each phase of work performed each day by NAS activity number.

d. Test and/or control activities performed with results and references to specifications/drawings requirements. Identify the control phase (Preparatory, Initial, Follow-up). List of deficiencies noted, along with corrective action.

e. Quantity of materials received at the site with statement as to acceptability, storage, and reference to specifications/drawings requirements.

f. Submittals and deliverables reviewed, with Contract reference, by whom, and action taken.

g. Offsite surveillance activities, including actions taken.

h. Job safety evaluations stating what was checked, results, and instructions or corrective actions. Include information identified by the "Responsible Individual(s)" for Safety as outlined in Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS.

i. Instructions given/received and conflicts in plans and/or specifications.

k. Verification Statement.

Indicate a description of trades working on the project; the number of personnel working; weather conditions encountered; and any delays encountered. Cover both conforming and deficient features and include a statement that equipment and materials incorporated in the work and workmanship comply with the Contract. Furnish the original and one copy of these records in report form to the Contracting Officer's Representative on the first day following the date(s) covered by the report, except that reports need not be submitted for days on which no work is performed. The Government may elect to process these records electronically. Coordinate with the Contracting Officer's Representative. As a minimum, prepare and submit one report for every 7 days of no work and on the last day of a no work period. All calendar days need to be accounted for throughout the life of the contract. The first report following a day of no work will be for that day only. Reports need to be signed and dated by the Contractor Quality Control(CQC) System Manager. Include copies of test reports and copies of reports prepared by all subordinate quality control personnel within the CQC System Manager Report.

## 3.10 SAMPLE FORMS

Generate daily quality control reports using the Government-furnished Construction Contractor Module of RMS specified in Section 01 45 00.15 10 RESIDENT MANAGEMENT SYSTEM CONTRACTOR MODE(RMS CM). A Sample Quality Control Report (QCR) Form is attached at the end of this section.

## 3.11 NOTIFICATION OF NONCOMPLIANCE

The Contracting Officer will notify the Contractor of any detected noncompliance with the foregoing requirements. Take immediate corrective action after receipt of such notice. Such notice, when delivered to the Contractor at the work site, will be deemed sufficient for the purpose of notification. If the Contractor fails or refuses to comply promptly, the Contracting Officer can issue an order stopping all or part of the work until satisfactory corrective action has been taken. No part of the time lost due to such stop orders will be made the subject of claim for extension of time or for excess costs or damages by the Contractor.

SECTION 01 45 00.15 10

RESIDENT MANAGEMENT SYSTEM CONTRACTOR MODE (RMS CM)
**11/16**

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this section to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. ARMY CORPS OF ENGINEERS (USACE)

| | |
|---|---|
| EM 385-1-1 | (2014) Safety and Health Requirements Manual |

1.2 MEASUREMENT AND PAYMENT

The work of this section is not measured for payment. The Contractor is responsible for the work of this section, without any direct compensation other than the payment received for contract items.

1.3 CONTRACT ADMINISTRATION

The Government will use the Resident Management System (RMS) to assist in its monitoring and administration of this contract. The Government accesses the system using the Government Mode of RMS (RMS GM) and the Contractor accesses the system using the Contractor Mode (RMS CM). The term RMS will be used in the remainder of this section for both RMS GM and RMS CM. The joint Government-Contractor use of RMS facilitates electronic exchange of information and overall management of the contract. The Contractor accesses RMS to record, maintain, input, track, and electronically share information with the Government throughout the contract period in the following areas:

Administration
Finances
Quality Control
Submittal Monitoring
Scheduling
Closeout
Import/Export of Data

1.3.1 Correspondence and Electronic Communications

For ease and speed of communications, exchange correspondence and other documents in electronic format to the maximum extent feasible. Some correspondence, including pay requests and payrolls, are also to be provided in paper format with original signatures. Paper documents will govern, in the event of discrepancy with the electronic version.

1.3.2 Other Factors

Other portions of this document have a direct relationship to the

reporting accomplished through RMS. Particular attention is directed to FAR 52.236-15 Schedules for Construction Contracts; FAR 52.232-27 Prompt Payment for Construction Contracts; FAR 52.232-5 Payments Under Fixed-Priced Construction Contracts; Section 01 32 01.00 10 PROJECT SCHEDULE; Section 01 33 00 SUBMITTAL PROCEDURES; Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS; and Section 01 45 00.00 10 QUALITY CONTROL.

## 1.4 RMS SOFTWARE

RMS is a web based application. Download, install and be able to utilize the latest version of RMS within 7 calendar days of receipt of the Notice to Proceed. RMS software, user manuals, access and installation instructions, program updates and training information are available from the RMS website (https://rms.usace.army.mil). The Government and the Contractor will have different access authorities to the same contract database through RMS. The common database will be updated automatically each time a user finalizes an entry or change.

## 1.5 CONTRACT DATABASE - GOVERNMENT

The Government will enter the basic contract award data in RMS prior to granting the Contractor access. The Government entries into RMS will generally be related to submittal reviews, correspondence status, and Quality Assurance(QA)comments, as well as other miscellaneous administrative information.

## 1.6 CONTRACT DATABASE - CONTRACTOR

Contractor entries into RMS establish, maintain, and update data throughout the duration of the contract. Contractor entries generally include prime and subcontractor information, daily reports, submittals, RFI's, schedule updates and payment requests. RMS includes the ability to import attachments and export reports in many of the modules, including submittals. The Contractor responsibilities for entries in RMS typically include the following items:

### 1.6.1 Administration

#### 1.6.1.1 Contractor Information

Enter all current Contractor administrative data and information into RMS within 7 calendar days of receiving access to the contract in RMS. This includes, but is not limited to, Contractor's name, address, telephone numbers, management staff, and other required items.

#### 1.6.1.2 Subcontractor Information

Enter all missing subcontractor administrative data and information into RMS CM within 7 calendar days of receiving access to the contract in RMS or within 7 calendar days of the signing of the subcontractor agreement for agreements signed at a later date. This includes name, trade, address, phone numbers, and other required information for all subcontractors. A subcontractor is listed separately for each trade to be performed.

#### 1.6.1.3 Correspondence

Identify all Contractor correspondence to the Government with a serial

number. Prefix correspondence initiated by the Contractor's site office with "S". Prefix letters initiated by the Contractor's home (main) office with "H". Letters are numbered starting from 0001. (e.g., H-0001 or S-0001). The Government's letters to the Contractor will be prefixed with "C" or "RFP".

1.6.1.4 Equipment

Enter and maintain a current list of equipment planned for use or being used on the jobsite, including the most recent and planned equipment inspection dates.

1.6.1.5 Reports

Track the status of the project utilizing the reports available in RMS. The value of these reports is reflective of the quality of the data input. These reports include the Progress Payment Request worksheet, Quality Control (QC) comments, Submittal Register Status, and Three-Phase Control worksheets.

1.6.1.6 Request For Information (RFI)

Create and track all Requests For Information (RFI) in the RMS Administration Module for Government review and response.

1.6.2 Finances

1.6.2.1 Pay Activity Data

Develop and enter a list of pay activities in conjunction with the project schedule. The sum of pay activities equals the total contract amount, including modifications. Each pay activity must be assigned to a Contract Line Item Number (CLIN). The sum of the activities assigned to a CLIN equals the amount of each CLIN.

1.6.2.2 Payment Requests

Prepare all progress payment requests using RMS. Update the work completed under the contract at least monthly, measured as percent or as specific quantities. After the update, generate a payment request and prompt payment certification using RMS. Submit the signed prompt payment certification and payment request as well as supporting data either electronically or by hard copy. Unless waived by the Contracting Officer, a signed paper copy of the approved payment certification and request is also required and will govern in the event of discrepancy with the electronic version.

1.6.3 Quality Control (QC)

Enter and track implementation of the 3-phase QC Control System, QC testing, transferred and installed property and warranties in RMS. Prepare daily reports, identify and track deficiencies, document progress of work, and support other Contractor QC requirements in RMS. Maintain all data on a daily basis. Insure that RMS reflects all quality control methods, tests and actions contained within the Contractor Quality Control (CQC) Plan and Government review comments of same within 7 calendar days of Government acceptance of the CQC Plan.

1.6.3.1 Quality Control (QC) Reports

The Contractor's Quality Control (QC) Daily Report in RMS is the official report. The Contractor can use other supplemental formats to record QC data, but information from any supplemental formats are to be consolidated and entered into the RMS QC Daily Report. Any supplemental information may be entered into RMS as an attachment to the report. QC Daily Reports must be finalized and signed in RMS within 24 hours after the date covered by the report. Provide the Government a printed signed copy of the QC Daily Report, unless waived by the Contracting Officer.

1.6.3.2 Deficiency Tracking.

Use the QC Daily Report Module to enter and track deficiencies. Deficiencies identified and entered into RMS by the Contractor or the Government will be sequentially numbered with a QC or QA prefix for tracking purposes. Enter each deficiency into RMS the same day that the deficiency is identified. Monitor, track and resolve all QC and QA entered deficiencies. A deficiency is not considered to be corrected until the Government indicates concurrence in RMS.

1.6.3.3 Three-Phase Control Meetings

Maintain scheduled and actual dates and times of preparatory and initial control meetings in RMS. Worksheets for the three-phase control meetings are generated within RMS.

1.6.3.4 Labor and Equipment Hours

Enter labor and equipment exposure hours on a daily basis. Roll up the labor and equipment exposure data into a monthly exposure report.

1.6.3.5 Accident/Safety Reporting

Both the Contractor and the Government enter safety related comments in RMS as a deficiency. The Contractor must monitor, track and show resolution for safety issues in the QC Daily Report area of the RMS QC Module. In addition, follow all reporting requirements for accidents and incidents as required in EM 385-1-1, Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS and as required by any other applicable Federal, State or local agencies.

1.6.3.6 Definable Features of Work

Enter each feature of work, as defined in the approved CQC Plan, into the RMS QC Module. A feature of work may be associated with a single or multiple pay activities, however a pay activity is only to be linked to a single feature of work.

1.6.3.7 Activity Hazard Analysis

Import activity hazard analysis electronic document files into the RMS QC Module utilizing the document package manager.

1.6.4 Submittal Management

Enter all current submittal register data and information into RMS within 7 calendar days of receiving access to the contract in RMS. The information shown on the submittal register following the specification

Section 01 33 00 SUBMITTAL PROCEDURES will already be entered into the RMS database when access is granted. Group electronic submittal documents into transmittal packages to send to the Government, except very large electronic files, samples, spare parts, mock ups, color boards, or where hard copies are specifically required. Track transmittals and update the submittal register in RMS on a daily basis throughout the duration of the contract. Submit hard copies of all submittals unless waived by the Contracting Officer.

1.6.5 Schedule

Enter and update the contract project schedule in RMS by either manually entering all schedule data or by importing the Standard Data Exchange Format (SDEF) file, based on the requirements in Section 01 32 01.00 10 PROJECT SCHEDULE.

1.6.6 Closeout

Closeout documents, processes and forms are managed and tracked in RMS by both the Contractor and the Government. Ensure that all closeout documents are entered, completed and documented within RMS.

1.7 IMPLEMENTATION

Use of RMS as described in the preceding paragraphs is mandatory. Ensure that sufficient resources are available to maintain contract data within the RMS system. RMS is an integral part of the Contractor's required management of quality control.

1.8 NOTIFICATION OF NONCOMPLIANCE

Take corrective action within 7 calendar days after receipt of notice of RMS non-compliance by the Contracting Officer.

FORT CARSON SPECIFIC REQUIREMENTS

| | |
|---|---|
| SPCCP | Spill Prevention, Control and Counter-Measures Plan |

1.2 DEFINITIONS

1.2.1 Environmental Pollution and Damage

Environmental pollution and damage is the presence of chemical, physical, or biological elements or agents which adversely affect human health or welfare; unfavorably alter ecological balances of importance to human life; affect other species of importance to humankind; or degrade the environment aesthetically, culturally and/or historically.

1.2.2 Environmental Protection

Environmental protection is the prevention/control of pollution and habitat disruption that may occur to the environment during construction. The control of environmental pollution and damage requires consideration of land, water, and air; biological and cultural resources; and includes management of visual aesthetics; noise; solid, chemical, gaseous, and liquid waste; radiant energy and radioactive material as well as other pollutants.

1.2.3 Contractor Generated Hazardous Waste

Contractor generated hazardous waste means materials that, if abandoned or disposed of, may meet the definition of a hazardous waste. These waste streams would typically consist of material brought on site by the Contractor to execute work, but are not fully consumed during the course of construction. Examples include, but are not limited to, excess paint thinners (i.e. methyl ethyl ketone, toluene etc.), waste thinners,excess paints, excess solvents, waste solvents, and excess pesticides, and contaminated pesticide equipment rinse water.

1.2.4 Installation Pest Management Coordinator

Installation Pest Management Coordinator (IPMC) is the individual officially designated by the Installation Commander to oversee the Installation Pest Management Program and the Installation Pest Management Plan.

1.2.5 Land Application for Discharge Water

The term "Land Application" for discharge water implies that the Contractor must discharge water at a rate which allows the water to percolate into the soil. No sheeting action, soil erosion, discharge into storm sewers, discharge into defined drainage areas, or discharge into the "waters of the United States" must occur. Land Application must be in compliance with all applicable Federal, State, and local laws and

regulations.

1.2.6 Pesticide

Pesticide is defined as any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest, or intended for use as a plant regulator, defoliant or desiccant.

1.2.7 Pests

The term "pests" means arthropods, birds, rodents, nematodes, fungi, bacteria, viruses, algae, snails, marine borers, snakes, weeds and other organisms (except for human or animal disease-causing organisms) that adversely affect readiness, military operations, or the well-being of personnel and animals; attack or damage real property, supplies, equipment, or vegetation; or are otherwise undesirable.

1.2.8 Surface Discharge

The term "Surface Discharge" implies that the water is discharged with possible sheeting action and subsequent soil erosion may occur. Waters that are surface discharged may terminate in drainage ditches, storm sewers,creeks, and/or "waters of the United States" and would require a permit to discharge water from the governing agency.

1.2.9 Waters of the United States

All waters which are under the jurisdiction of the Clean Water Act, as defined in 33 CFR 328.

1.2.10 Wetlands

Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, and bogs. Official determination of whether or not an area is classified as a wetland must be done in accordance with WETLAND MANUAL.

1.3 GENERAL REQUIREMENTS

Minimize environmental pollution and damage that may occur as the result of construction operations. The environmental resources within the project boundaries and those affected outside the limits of permanent work must be protected during the entire duration of this contract. Comply with all applicable environmental Federal, State, and local laws and regulations. Any delays resulting from failure to comply with environmental laws and regulations will be the Contractor's responsibility.

1.4 SUBCONTRACTORS

Ensure compliance with this section by subcontractors.

1.5 PAYMENT

No separate payment will be made for work covered under this section. Payment of fees associated with environmental permits, application, and/or notices obtained by the Contractor, and payment of all fines/fees for violation or non-compliance with Federal, State, Regional and local laws

and regulations are the Contractor's responsibility. All costs associated with this section must be included in the contract price.

## 1.6 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Environmental Protection Plan; G, RO

Fort Carson Air Quality Assessment Forms; G, RO

## 1.7 ENVIRONMENTAL PROTECTION PLAN

Prior to commencing construction activities or delivery of materials to the site, the Contractor shall submit an Environmental Protection Plan for review and approval by the Contracting Officer. The purpose of the Environmental Protection Plan is to present a comprehensive overview of known or potential environmental issues which the Contractor must address during construction. Issues of concern shall be defined within the Environmental Protection Plan as outlined in this section. The Contractor shall address each topic at a level of detail commensurate with the environmental issue and required construction task(s). Topics or issues which are not identified in this section, but which the Contractor considers necessary, shall be identified and discussed after those items formally identified in this section. Prior to submittal of the Environmental Protection Plan, the Contractor shall meet with the Contracting Officer for the purpose of discussing the implementation of the initial Environmental Protection Plan; possible subsequent additions and revisions to the plan including any reporting requirements; and methods for administration of the Contractor's Environmental Plans. The Contractor shall maintain a current version of the Environmental Protection Plan on site for review by interested parties.

### 1.7.1 Compliance

No requirement in this Section shall be construed as relieving the Contractor of any applicable Federal, State, and local environmental protection laws and regulations. During Construction, the Contractor shall be responsible for identifying, submitting for approval, and implementing any additional requirements to be included in the Environmental Protection Plan.

### 1.7.2 Contents

The environmental protection plan shall include, but shall not be limited to, the following:

a. Name(s) of person(s) within the Contractor's organization who is(are) responsible for ensuring adherence to the Environmental Protection Plan.

b. Name(s) and qualifications of person(s) responsible for manifesting hazardous waste to be removed from the site, if applicable.

c. Name(s) and qualifications of person(s) responsible for training the Contractor's environmental protection personnel.

d. Description of the Contractor's environmental protection personnel training program.

e. An erosion and sediment control plan which identifies the type and location of the erosion and sediment controls to be provided. The plan shall include monitoring and reporting requirements to assure that the control measures are in compliance with the erosion and sediment control plan, Federal, State, and local laws and regulations. A Storm Water Pollution Prevention Plan (SWPPP) may be substituted for this plan.

f. Drawings showing locations of proposed temporary excavations or embankments for haul roads, stream crossings, material storage areas, structures, sanitary facilities, and stockpiles of excess or spoil materials including methods to control runoff and to contain materials on the site.

g. Traffic control plans including measures to reduce erosion of temporary roadbeds by construction traffic, especially during wet weather. Plan shall include measures to minimize the amount of mud transported onto paved public roads by vehicles or runoff.

h. Work area plan showing the proposed activity in each portion of the area and identifying the areas of limited use or nonuse. Plan should include measures for marking the limits of use areas including methods for protection of features to be preserved within authorized work areas.

i. Drawing showing the location of borrow areas.

j. The Spill Control plan shall include the procedures, instructions, and reports to be used in the event of an unforeseen spill of a substance regulated by 40 CFR 68, 40 CFR 302, 40 CFR 355, and/or regulated under State or Local laws and regulations. The Spill Control Plan supplements the requirements of EM 385-1-1 and Fort Carson's Spill Prevention, Control and Counter-Measures Plan SPCCP. This plan shall include as a minimum:

1. The name of the individual who will report any spills or hazardous substance releases and who will follow up with complete documentation. This individual shall immediately notify the Fort Carson's Fire Department, the Contracting Officer, and Fort Carson's Directorate of Public Works Office, Environmental Office in addition to the legally required Federal, State, and local reporting channels (including the National Response Center 1-800-424-8802) if a reportable quantity is released to the environment. The plan shall contain a list of the required reporting channels and telephone numbers.

2. The name and qualifications of the individual who will be responsible for implementing and supervising the containment and cleanup.

3. Training requirements for Contractor's personnel and methods of accomplishing the training.

4. A list of materials and equipment to be immediately available at the job site, tailored to cleanup work of the potential hazard(s) identified.

5. The names and locations of suppliers of containment materials and locations of additional fuel oil recovery, cleanup, restoration, and material-placement equipment available in case of an unforeseen spill emergency.

6. The methods and procedures to be used for expeditious contaminant cleanup.

k. A non-hazardous solid waste disposal plan identifying methods and locations for solid waste disposal including clearing debris. The plan shall include schedules for disposal. The Contractor shall identify any subcontractors responsible for the transportation and disposal of solid waste. Licenses or permits shall be submitted for solid waste disposal sites that are not a commercial operating facility. Evidence of the disposal facility's acceptance of the solid waste shall be attached to this plan during the construction. The Contractor shall attach a copy of each of the Non-hazardous Solid Waste Diversion Reports to the disposal plan. The report shall be submitted on the first working day after the first quarter that non-hazardous solid waste has been disposed and/or diverted and shall be for the previous quarter (e.g. the first working day of January, April, July, and October). The report shall indicate the total amount of waste generated and total amount of waste diverted in cubic yards or tons along with the percent that was diverted.

l. A recycling and solid waste minimization plan with a list of measures to reduce consumption of energy and natural resources. The plan shall detail the Contractor's actions to comply with and to participate in Federal, State, Regional, and local government sponsored recycling programs to reduce the volume of solid waste at the source.

m. An air pollution control plan detailing provisions to assure that dust, debris, materials, trash, etc., do not become air borne and travel off the project site.

n. A contaminant prevention plan that: identifies potentially hazardous substances to be used on the job site; identifies the intended actions to prevent introduction of such materials into the air, water, or ground; and details provisions for compliance with Federal, State, and local laws and regulations for storage and handling of these materials. In accordance with EM 385-1-1, a copy of the Material Safety Data Sheets (MSDS) and the maximum quantity of each hazardous material to be on site at any given time shall be included in the contaminant prevention plan. As new hazardous materials are brought on site or removed from the site, the plan shall be updated.

o. A waste water management plan that identifies the methods and procedures for management and/or discharge of waste waters which are directly derived from construction activities, such as concrete curing water, clean-up water, dewatering of ground water, disinfection water, hydrostatic test water, and water used in flushing of lines. If a settling/retention pond is required, the plan shall include the design

of the pond including drawings, removal plan, and testing requirements for possible pollutants. If land application will be the method of disposal for the waste water, the plan shall include a sketch showing the location for land application along with a description of the pretreatment methods to be implemented. If surface discharge will be the method of disposal, a copy of the permit and associated documents shall be included as an attachment prior to discharging the waste water. If disposal is to a sanitary sewer, the plan shall include documentation that the Waste Water Treatment Plant Operator has approved the flow rate, volume, and type of discharge.

p. A historical, archaeological, cultural, biological, and wetland resources plan that defines procedures for identifying and protecting the resources known to be on the project site and any resources discovered during construction. The plan shall identify lines of communication between Contractor personnel and the Contracting Officer.

q. A pesticide treatment plan shall be included and updated, as information becomes available. The plan shall include: sequence of treatment, dates, times, locations, pesticide trade name, EPA registration numbers, authorized uses, chemical composition, formulation, original and applied concentration, application rates of active ingredient (i.e. pounds of active ingredient applied), equipment used for application and calibration of equipment. The Contractor is responsible for Federal, State, Regional and Local pest management record keeping and reporting requirements as well as any additional specific requirements.

1.7.3 Appendix

Copies of all environmental permits, permit application packages, approvals to construct, notifications, certifications, reports, and termination documents shall be attached,as an appendix, to the Environmental Protection Plan.

1.8 PROTECTION FEATURES

This paragraph supplements the Contract Clause PROTECTION OF EXISTING VEGETATION, STRUCTURES, EQUIPMENT, UTILITIES, AND IMPROVEMENTS. Prior to start of any on site construction activities, the Contractor and the Contracting Officer shall make a joint condition survey. Immediately following the survey, the Contractor shall prepare a brief report including a plan describing the features requiring protection under the provisions of the Contract Clauses, which are not specifically identified on the drawings as environmental features requiring protection along with the condition of trees, shrubs and grassed areas immediately adjacent to the site of work and adjacent to the Contractor's assigned storage area and access route(s), as applicable. This survey report shall be signed by both the Contractor and the Contracting Officer upon mutual agreement as to its accuracy and completeness. The Contractor shall protect those environmental features included in the survey report and any indicated on the drawings, regardless of interference which their preservation may cause to the Contractor's work under the contract.

1.9 ENVIRONMENTAL ASSESSMENT OF CONTRACT DEVIATIONS

Any deviations, requested by the Contractor, from the drawings, plans and specifications which may have an environmental impact will be subject to approval by the Contracting Officer and may require an extended review,

processing, and approval time. The Contracting Officer reserves the right to disapprove alternate methods, even if they are more cost effective, if the Contracting Officer determines that the proposed alternate method will have an adverse environmental impact.

1.10 NOTIFICATION

The Contracting Officer will notify the Contractor in writing of any observed noncompliance with Federal, State or local environmental laws or regulations, permits, and other elements of the Contractor's Environmental Protection plan. The Contractor shall, after receipt of such notice, inform the Contracting Officer of the proposed corrective action and take such action when approved by the Contracting Officer. The Contracting Officer may issue an order stopping all or part of the work until satisfactory corrective action has been taken. No time extensions shall be granted or equitable adjustments allowed to the Contractor for any such suspensions. This is in addition to any other actions the Contracting Officer may take under the contract, or in accordance with the Federal Acquisition Regulation or Federal Law.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 ENVIRONMENTAL PERMITS, REVIEWS, APPROVALS, AND NOTIFICATIONS

This paragraph supplements the Contractor's responsibility under the contract clause "PERMITS AND RESPONSIBILITIES". The Contractor shall be responsible for obtaining all environmental construction permits, approvals, and/or submitting notifications required by Federal, State, Regional, and local environmental laws and regulations.

3.1.1 State of Colorado Fugitive Dust Permit

The Contractor shall be responsible for obtaining the State of Colorado Land Development (Fugitive Dust)permit prior to construction commencing. The State of Colorado may take a maximum of 90-days to review and issue the permit. The Contractor shall be responsible for completing, modifying any information to comply with the State of Colorado laws and regulations, and submitting the attached Air Pollutant Emission Notice(APEN)-and-Application for Construction permit including the Land Development-Fugitive Dust Control Plan, and the Notice of Start-up (which is required to be submitted 30 days prior to commencement of construction) along with the project's grading plan to the State of Colorado. The Contractor is responsible for payment of all fees associated with the permit.The Contractor will submit the APEN directly to the State of Colorado as soon as the authority to advertise is received. The Contractor should also forward a copy of the permit to Fort Carson DPW-ED Air Program.

3.1.2 EPA's National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharge Associated with Construction Sites

The Contractor and the Government shall be co-permittee's for EPA's National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharge Associated with Construction Sites on Federal Lands in the State of Colorado if the Corps of Engineers is the design agent. If the Contractor is the design agent as well as the Construction Contractor then the Contractor is the sole permittee for EPA's National

Pollution Discharge Elimination System (NPDES) General Permit for Storm Water Discharge Associated with Construction Sites on Federal Lands in the State of Colorado. Construction activities results in the disturbance of 1 acre of land or more, coverage under the EPA Storm Water General Permit For Construction Activities (Colorado Permit No. COR17###F) is required. See SECTION 01 41 26.05 24 NPDES PERMITS FOR STORM WATER DISCHARGES FROM CONSTRUCTION SITES.

3.1.3 Erosion and Stormwater Quality Control Permit (ESQCP)

If more than one acre of ground is going to be disturbed on non-federal facilities (private property) the Contractor shall be responsible for obtaining an Erosion and Stormwater Quality Control Permit from El Paso County, Colorado. A copy of the permit and requirements may be found at the El Paso County, Colorado web site http://adm.elpasoco.com/Development%20Services/Pages/InspectionsHomePage.aspx. The Contractor shall be responsible for any fees associated with this permit. Copies of any permits shall be furnished to the COR for approval prior to submission to El Paso County.

3.1.4 Municipal Separate Storm Sewer Systems (MS4) Permit

Fort Carson is under a Municipal Separate Storm Sewer System (MS4) permit, issued by the US Environmental Protection Agency (EPA), which allows discharges of stormwater from Fort Carson. The MS4 permit also requires Fort Carson to manage a stormwater program and enforce compliance with EPA-issued permits. The following are requirements under the MS4 permit which are not required in the Construction General Permit for NPDES and must be included in the SWPPP. The MS4 permit also requires Fort Carson to manage a stormwater program and enforce compliance with EPA-issued permits. Attached is a Fort Carson Stormwater Program Project Information Form which needs to be completed and submitted to Fort Carson Stormwater Program Manager with Fort Carson Directorate of Public Works, Environmental Division prior to the start of the project.

- A dewatering plan will need to be included in the SWPPP, as the State of Colorado dewatering permit does not apply to Fort Carson.
- Cover trash containers at all times. When trash container is approximately 85% full, haul container to approved dump location.
- All concrete washouts need to be lined. The exchangeable pans are acceptable, as long as the washout water is managed adequately.

3.1.5 Section 438 of the Energy Independence and Security Act (EISA)

Projects that developed with a footprint greater than or equal to 5,000 square feet are required to comply with Section 438 of the Energy Independence and Security Act (EISA) by properly designing and installing Low Impact Development (LID)/Best Management Practice (BMP) features that allow for the pre-development hydrology of the areas to be maintained after construction. The attached for entitled "Maintaining Hydrology on Army Construction Projects" shall be completed by the LID Designer of Record and submitted to the COR and Fort Carson Stormwater Program Office with the final design package. The form shall be revised as necessary by the Designer or Record to reflect as built conditions if they differ from the final design package. Projects that are not in full compliance with the EISA, shall have a technical infeasibility report created by the Design of Record and shall be attached to the Maintaining Hydrology on Army Construction Projects Form. The Designer of Record shall use Option 1 of the EPA's EISA 438 technical guidance for their calculations. If

any other method is necessary due to site-specific requirements, the method shall be approved by the COR and Fort Carson Stormwater Program Office prior to use. Due to water rights requirements in the State of Colorado, all LID/BMP features must be designed to ensure that all water is released from the feature within 72 hours of the end of the precipitation event.

### 3.1.6 Notification of Demolition and Renovation

The Contractor shall be responsible for coordinating and submitting the notification of demolition and renovation to the governing agency in accordance with all Federal, State, Regional, and local environmental laws and regulations.

### 3.1.7 Clean Air Act

This project is located in a CO emissions maintenance area and therefore the Contractor must provide the number and type of vehicles, equipment etc., to be used during the project to the Directorate of Public Works (DPW), Environmentl Division at Fort Carson. The DPW, Environmental Division will perform an impact analysis as part of their environmental assessment to determine if the project will meet conformity requirements of the Clean Air Act.

## 3.2 LAND RESOURCES

The Contractor shall confine all activities to areas defined by the drawings and specifications. Prior to the beginning of any construction, the Contractor shall identify any land resources to be preserved within the work area. Except in areas indicated on the drawings or specified to be cleared, the Contractor shall not remove, cut, deface, injure, or destroy land resources including trees, shrubs, vines, grasses, topsoil, and land forms without approval. No ropes, cables, or guys shall be fastened to or attached to any trees for anchorage unless specifically authorized. The Contractor shall provide effective protection for land and vegetation resources at all times as defined in the following subparagraphs. Stone, soil, or other materials displaced into uncleared areas shall be removed by the Contractor.

### 3.2.1 Work Area Limits

Prior to commencing construction activities, the Contractor shall mark the areas that need not be disturbed under this contract. Isolated areas within the general work area which are not to be disturbed shall be marked or fenced. Monuments and markers shall be protected before construction operations commence. Any markers shall be visible in the dark. The Contractor's personnel shall be knowledgeable of the purpose for marking and/or protecting particular objects.

### 3.2.2 Landscape

Trees, shrubs, vines, grasses, land forms and other landscape features indicated and defined on the drawings to be preserved shall be clearly identified by marking, fencing, or wrapping with boards, or any other approved techniques. The Contractor shall restore landscape features damaged or destroyed during construction operations outside the limits of the approved work area.

#### 3.2.2.1 Stabilization

All disturbed areas must be stabilized (i.e. landscaping, seed, gravel, etc.) to achieve a stabilization of 70% preexisting condition prior to project completion. Seed mix will be approved by Fort Carson prior to seeding and will similar to those grasses in the immediate disturbed area. New grasses must be drill seeded unless approved otherwise. Irrigation and maintenance including weed mowing may be required until seeded area is stabilized. Annual weeds will not be accepted as stabilization. Coordination with the Stormwater Office must be made prior to terminating Construction General Permit coverage

### 3.2.3 Erosion and Sediment Controls

The Contractor shall be responsible for providing erosion and sediment control measures in accordance with Federal, State, and local laws and regulations. The erosion and sediment controls selected and maintained by the Contractor shall be such that water quality standards are not violated as a result of the Contractor's construction activities. The area of bare soil exposed at any one time by construction operations should be kept to a minimum. The Contractor shall construct or install temporary and permanent erosion and sediment control best management practices (BMPs) as specified in Section 01 57 23 TEMPORARY STORM WATER POLLUTION CONTROL. BMPs may include, but not be limited to, vegetation cover, stream bank stabilization, slope stabilization, silt fences, construction of terraces, interceptor channels, sediment traps, inlet and outfall protection, diversion channels, and sedimentation basins. Any temporary measures shall be removed after the area has been stabilized.

### 3.2.4 Contractor Facilities and Work Areas

The Contractor's field offices, staging areas, stockpile storage, and temporary buildings shall be placed in areas by the Contractor andapproved by the Contracting Officer. Temporary movement or relocation of Contractor facilities shall be made only when approved. Erosion and sediment controls shall be provided for on-site borrow and spoil areas to prevent sediment from entering nearby waters. Temporary excavation and embankments for plant and/or work areas shall be controlled to protect adjacent areas.

## 3.3 WATER RESOURCES

The Contractor shall monitor construction activities to prevent pollution of surface and ground waters. Toxic or hazardous chemicals shall not be applied to soil or vegetation unless otherwise indicated. All water areas affected by construction activities shall be monitored by the Contractor. For construction activities immediately adjacent to impaired surface waters, the Contractor shall be capable of quantifying sediment or pollutant loading to that surface water when required by State or Federally issued Clean Water Act permits.

## 3.4 AIR RESOURCES

Equipment operation, activities, or processes performed by the Contractor shall be in accordance with all Federal and State air emission and performance laws and standards.

3.4.1 Particulates

Dust particles; aerosols and gaseous by-products from construction activities; and processing and preparation of materials, such as from asphalt batch plants; shall be controlled at all times, including weekends, holidays and hours when work is not in progress. The Contractor shall maintain excavations, stockpiles, haul roads, permanent and temporary access roads, plant sites, spoil areas, borrow areas, and other work areas within or outside the project boundaries free from particulates which would cause the Federal, State, and local air pollution standards to be exceeded or which would cause a hazard or a nuisance. Sprinkling, chemical treatment of an approved type, baghouse, scrubbers, electrostatic precipitators or other methods will be permitted to control particulates in the work area. Sprinkling, to be efficient, must be repeated to keep the disturbed area damp at all times. The Contractor must have sufficient, competent equipment available to accomplish these tasks. Particulate control shall be performed as the work proceeds and whenever a particulate nuisance or hazard occurs. The Contractor shall comply with all State and local visibility regulations. The Contractor shall comply with the attached Fugitive Dust Control Plan for Land Development and State of Colorado Fugitive Dust Permit.

3.4.2 Fort Carson Directorate of Public Works, Environmental Division Air Program - Information Required for General Conformity Review

The Contractor shall complete the following Information Required for General Conformity Review for the DPW, Environmental Division, Air Program at Fort Carson Army Base.

Fort Carson Air Quality Assessment Forms

The Contractor shall provide the information to the Directorate of Public Works, Environmental Division, Air Quality Program Attention Chad Meister at the same time the State and County permits are sent in, prior to the initiation of the proposed action or project. The Fort Carson Air Quality Assessment Forms will be kept current, and COR reserves the right to request the current form and validate data prior to making progress payments. The Part B portion of the Fort Carson Air Quality Assessment Forms will be submitted to the COR quarterly and at the completion of the project.

3.4.3 Odors

Odors from construction activities shall be controlled at all times. The odors shall not cause a health hazard and shall be in compliance with State of Colorado regulations and/or local ordinances.

3.4.4 Sound Intrusions

The Contractor shall keep construction activities under surveillance and control to minimize environment damage by noise. The Contractor shall comply with the provisions of the State of Colorado rules.

3.4.5 Burning

Burning shall be prohibited on the Government premises.

## 3.5 MANAGEMENT AND DISPOSAL OF WASTE AND CHEMICAL MATERIALS

Management and disposal of wastes and chemical materials shall be as directed below, unless otherwise specified in other sections and/or shown on the drawings. The Army has a "Sustainability" goal to reduce by 60% the amount of construction related debris that is deposited in local landfills. Material that are recyclable, e.g., concrete, asphalt, aluminum, copper, brass, steel, plastic, cardboard, glass, etc., shall be recycled so as to minimize impact on local landfills.

### 3.5.1 Solid Wastes

Solid wastes (excluding clearing debris) shall be placed in containers which are emptied on a regular schedule. Handling, storage, and disposal shall be conducted to prevent contamination. Segregation measures shall be employed so that no hazardous or toxic waste will become co-mingled with solid waste. The Contractor shall transport solid waste off Government property and dispose of it in compliance with Federal, State, and local requirements for solid waste disposal. A Subtitle D RCRA permitted landfill shall be the minimum acceptable off-site solid waste disposal option. The Contractor shall verify that the selected transporters and disposal facilities have the necessary permits and licenses to operate.

### 3.5.2 Chemicals and Chemical Wastes

Chemicals shall be dispensed ensuring no spillage to the ground or water. Periodic inspections of dispensing areas to identify leakage and initiate corrective action shall be performed and documented. This documentation will be periodically reviewed by the Government. Chemical waste shall be collected in corrosion resistant, compatible containers. Collection drums shall be monitored and removed to a staging or storage area when contents are within 6 inches of the top. Wastes shall be classified, managed, stored, and disposed of in accordance with Federal, State, and local laws and regulations.

### 3.5.3 Contractor Generated Hazardous Wastes/Excess Hazardous Materials

Hazardous wastes are defined in 40 CFR 261, or are as defined by applicable State and local regulations. Hazardous materials are defined in 49 CFR 171 - 178. The Contractor shall, at a minimum, manage and store hazardous waste in compliance with 40 CFR 262. The Contractor shall take sufficient measures to prevent spillage of hazardous and toxic materials during dispensing. The Contractor shall segregate hazardous waste from other materials and wastes, shall protect it from the weather by placing it in a safe covered location, and shall take precautionary measures such as berming or other appropriate measures against accidental spillage. The Contractor shall be responsible for storage, describing, packaging, labeling, marking, and placarding of hazardous waste and hazardous material in accordance with 49 CFR 171 - 178, State, and local laws and regulations. The Contractor shall transport Contractor generated hazardous waste off Government property within 60 days in accordance with the Environmental Protection Agency and the Department of Transportation laws and regulations. The Contractor shall dispose of hazardous waste in compliance with Federal, State and local laws and regulations. Spills of hazardous or toxic materials shall be immediately reported to the Contracting Officer. Cleanup and cleanup costs due to spills shall be the Contractor's responsibility. The disposition of Contractor generated hazardous waste and excess hazardous materials are the Contractor's

responsibility.

3.5.4 Fuel and Lubricants

Storage, fueling and lubrication of equipment and motor vehicles shall be conducted in a manner that affords the maximum protection against spill and evaporation. Fuel, lubricants and oil shall be managed and stored in accordance with all Federal, State, Regional, and local laws and regulations. Used lubricants and used oil to be discarded shall be stored in marked corrosion-resistant containers and recycled or disposed in accordance with 40 CFR 279, State, and local laws and regulations. There shall be no storage of fuel on the project site. Fuel must be brought to the project site each day that work is performed.

3.5.5 Waste Water

Disposal of waste water shall be as specified below.

a. Waste water from construction activities, such as on site material processing, concrete curing, foundation and concrete clean-up, water used in concrete trucks, forms, etc. shall not be allowed to enter water ways or to be discharged prior to being treated to remove pollutants. The Contractor shall dispose of the construction related waste water off-Government property in accordance with all Federal, State, Regional and Local laws and regulations or by collecting and placing it in a leak-proof container or leak proof andlined retention pond designed so that no overflows can occure due to inadequate sizing or preceipitation and where suspended material can be settled out and/or the water can evaporate to separate pollutants from the water. The site for the retention pond shall be coordinated with and approved by the Contracting Officer. At the time of completion of the project, the water and residue left in the pond shall be removed, tested, and disposed off-Government property in accordance with Federal, State, and local laws and regulations. The area shall be backfilled to the original grade, top-soiled and seeded/sodded.

b. Ground water encountered during construction activities shall be land applied on-site. The Contractor will be required to follow Fort Carson Stormwater Program dewatering requirements. A separate dewatering permit is not required if water is discharged in accordance with EPA's 2017 Construction General Permit. The Contractor shall discharge the water at a rate which allows the water to percolate into the soil. No sheeting action, soil erosion, discharge into storm sewers, defined drainage areas, or discharge into the "waters of the State" shall occur.

c. Water generated from the flushing of lines after disinfection or disinfection in conjunction with hydrostatic testing shall be discharged into the sanitary sewer with prior approval from Fort Carson's Waste Water Treatment Plant Operator. The discharged water must be dechlorinated prior to discharge to the sanitary sewer.

3.6 RECYCLING AND WASTE MINIMIZATION

The Contractor shall participate in State and local government sponsored recycling programs. The Contractor shall recycle acceptable cardboard and paper products through Fort Carson's Environmental Compliance Division,

Office of Solid Waste, 719-526-5898. Fort Carson will deliver receptacles to the project site and will pick-up the receptacles on a regular schedule for the cardboard and paper products. The Contractor is further encouraged to minimize solid waste generation throughout the duration of the project.

## 3.7 NON-HAZARDOUS SOLID WASTE DIVERSION REPORT

The Contractor shall maintain an inventory of non-hazardous solid waste diversion and disposal of construction and demolition debris. The Contractor shall submit a report to Fort Carson's Directorate of Public Work, Environmental Division Office through the Contracting Officer on the first working day after each fiscal year quarter, starting the first quarter that non-hazardous solid waste has been generated. The following shall be included in the report:

a. Construction and Demolition (C&D) Debris Disposed = _____ in cubic yards or tons, as appropriate.

b. Construction and Demolition (C&D) Debris Recycled = _____ in cubic yards or tons, as appropriate.

c. Total C&D Debris Generated = _____ in cubic yards or tons, as appropriate.

d. Waste Sent to Waste-To-Energy Incineration Plant (This amount should not be included in the recycled amount) = _____ in cubic yards or tons, as appropriate.

## 3.8 HISTORICAL, ARCHAEOLOGICAL, AND CULTURAL RESOURCES

If during excavation or other construction activities any previously unidentified or unanticipated historical, archaeological, and cultural resources are discovered or found, all activities that may damage or alter such resources shall be temporarily suspended. Resources covered by this paragraph include but are not limited to: any human skeletal remains or burials; artifacts; shell, midden, bone, charcoal, or other deposits; rock or coral alignments, pavings, wall, or other constructed features; and any indication of agricultural or other human historical activities. Upon such discovery or find, the Contractor shall immediately notify the Contracting Officer so that the appropriate authorities may be notified and a determination made as to their significance and what, if any, special disposition of the finds should be made. The Contractor shall cease all activities that may result in impact to or the destruction of these resources. The Contractor shall secure the area and prevent Contractor personnel or other persons from trespassing on, removing, or otherwise disturbing such resources.

## 3.9 BIOLOGICAL RESOURCES

The Contractor shall minimize interference with, disturbance to, and damage to fish, wildlife, and plants including their habitat. The Contractor shall be responsible for the protection of threatened and endangered animal and plant species including their habitat in accordance with Federal, State, Regional, and local laws and regulations.

### 3.9.1 Migratory Bird Treaty Act

Clearing and grubbing shall be scheduled so as to avoid disturbance to any active nests of migratory birds covered by the above Act. Normally, that

allows clearing only from 15 September to 31 January. However, subject to the results of a survey by a qualified biologist, the CO may determine that trees in the work area are free of nests, and allow such trees to be cleared outside the stated time window. Adherence to these guidelines will help avoid any unnecessary take of migratory birds and the penalties specified in the Act and associated regulations. The Contractor can contact the Fort Carson DPW Wildlife to conduct a bird survey of the project area within two weeks of construction start. Fort Carson DPW Wildlife can be contacted at 719-524-5395.

## 3.10 INTEGRATED PEST MANAGEMENT

In order to minimize impacts to existing fauna and flora, the Contractor, through the Contracting Officer, shall coordinate with the Installation Pest Management Coordinator (IPMC) at the earliest possible time prior to pesticide application. The Contractor shall discuss integrated pest management strategies with the IPMC and receive concurrence from the IPMC through the COR prior to the application of any pesticide associated with these specifications. Installation Pest Management personnel shall be given the opportunity to be present at all meetings concerning treatment measures for pest or disease control and during application of the pesticide. The use and management of pesticides are regulated under 40 CFR 150 - 189.

### 3.10.1 Pesticide Delivery and Storage

Pesticides shall be delivered to the site in the original, unopened containers bearing legible labels indicating the EPA registration number and the manufacturer's registered uses. Pesticides shall be stored according to manufacturer's instructions and under lock and key when unattended.

### 3.10.2 Qualifications

For the application of pesticides, the Contractor shall use the services of a subcontractor whose principal business is pest control. The subcontractor shall be licensed and certified in the state where the work is to be performed.

### 3.10.3 Pesticide Handling Requirements

The Contractor shall formulate, treat with, and dispose of pesticides and associated containers in accordance with label directions and shall use the clothing and personal protective equipment specified on the labeling for use during all phases of the application. Material Safety Data Sheets (MSDS)shall be available for all pesticide products.

### 3.10.4 Application

Pesticides shall be applied by a State Certified Pesticide Applicator in accordance with EPA label restrictions and recommendation. The Certified Applicator shall wear clothing and personal protective equipment as specified on the pesticide label. Water used for formulating shall only come from locations designated by the Contracting Officer. The Contractor shall not allow the equipment to overflow. Prior to application of pesticide, all equipment shall be inspected for leaks, clogging, wear, or damage and shall be repaired prior to being used.

## 3.11 PREVIOUSLY USED EQUIPMENT

The Contractor shall clean all previously used construction equipment prior to bringing it onto the project site. The Contractor shall ensure that the equipment is free from soil residuals, egg deposits from plant pests, noxious weeds, and plant seeds. The Contractor shall consult with the USDA jurisdictional office for additional cleaning requirements.

## 3.12 MAINTENANCE OF POLLUTION FACILITIES

The Contractor shall maintain permanent and temporary pollution control facilities and devices for the duration of the contract or for that length of time construction activities create the particular pollutant.

## 3.13 MILITARY MUNITIONS

In the event the Contractor discovers or uncovers military munitions as defined in 40 CFR 260, the Contractor shall immediately stop work in that area and immediately inform the Contracting Officer.

## 3.14 TRAINING OF CONTRACTOR PERSONNEL

The Contractor's personnel shall be trained in all phases of environmental protection and pollution control. The training and all additional meetings shall be document with the date, time, name of trainer, attendees of the training, and subjects covered. The Contractor shall conduct environmental protection/pollution control meetings for all Contractor personnel prior to commencing construction activities. Additional meetings shall be conducted for new personnel and when site conditions change. The training and meeting agenda shall include: methods of detecting and avoiding pollution; familiarization with statutory and contractual pollution standards; installation and care of devices, vegetative covers, and instruments required for monitoring purposes to ensure adequate and continuous environmental protection/pollution control; anticipated hazardous or toxic chemicals or wastes, and other regulated contaminants; recognition and protection of archaeological sites, artifacts, wetlands, and endangered species and their habitat that are known to be in the area.

## 3.15 POST CONSTRUCTION CLEANUP

The Contractor shall clean up all areas used for construction in accordance with Contract Clause: "Cleaning Up". The Contractor shall, unless otherwise instructed in writing by the Contracting Officer, obliterate all signs of temporary construction facilities such as haul roads, work area, structures, foundations of temporary structures, stockpiles of excess or waste materials, and other vestiges of construction prior to final acceptance of the work. The disturbed area shall be graded, filled and the entire area seeded unless otherwise indicated.

-- End of Section --

Prepared by the FTC Directorate of Public Works - Environmental Division
Air Quality Program

Version 4.12-0, approved for release 4/1/2012

# INSTRUCTIONS

**Introduction**

This guide is intended to provide Project Proponents, Contractors, and DPW staff with the basic and essential information required to maintain compliance with the various AIR EMISSIONS CONTROL regulatory agencies, statutory requirements, permits, and sustainability efforts that Fort Carson (FTC) must adhere to.

The AIR QUALITY ASSESSMENT form (AQA) has been integrated into this guide, and is the essential reporting and planning document used by the Air Program to ensure compliance with the various New Source Review laws, Ozone Depleting Substance management, New Source Performance Standards, the FTC Title V Operating Permit (95OPEP110), Green House Gas Reporting, General Conformity, and Prevention of Significant Deterioration (PSD) regulations.

**Responsibility**

The Proponent / Contractor is responsible for reading and understanding the requirements outlined in this guide in there entirety, and then completing the applicable portions of the Air Quality Assessment form.

The Air Program will analyze the project / action to determine if a threshold of significance will be exceeded and then document the findings in the NEPA review. You may be contacted to gather additional information for further analysis. A full general conformity analysis, PSD permit, or Construction permit (New Source Review (NSR)) MAY BE REQUIRED. Please be advised that any required permit **MUST BE RECEIVED PRIOR TO THE START OF CONSTRUCTION,** and can take anywhere from 120 to 180 days to receive (PSD permits can take 18+ months).

**AQA Form Instructions**

1.) Complete only the AQA form sections (1 - 6) that are applicable to your project, activity, or task. If a section does not apply, use the check box at the top of the section to indicate so. It is critical that you provide accurate information regarding the proposed activity as it will be come the basis for required permit and NEPA actions.

2) Part A and Part B Requirements: The POC for the project is to determine what portions of the AQA to be completed for submission to the FTC Air Program. Depending on the air requirement being addressed, the AQA should be submitted no less than 3 weeks prior to the initiation of the proposed project. NOTE: for air quality permits on new sources, the lead time is 180 days prior to construction. Part B requirements, if applicable, are due at the conclusion of the project or on an annual basis if the project spans multiple years.

**Electronic submission is preferred.**

3.) Provide all required data in the green shaded cells if applicable. Several cells contain conditional formatting and data validation (drop down) that will require the preparer to select the most approximate match for the data to be provided.

In the box below place an "X" next to the air quality area you anticipate submitting information to the Fort Carson Air Program. By clicking on the title you will be linked to information regarding that air quality area. By clicking on the Section Tab you will be hyperlinked to the specific data information sheet.

| | Reserved for future use | Section 7 |

(This part left blank)

**Fugitive Particulate Matter (PM) Definition** Back to Menu

Fugitive Particulate Emissions; As defined under Colorado AQCR, means fugitive emissions of particulate matter that are the direct or proximate result of man's activities, (e.g., Materials left by man from development projects that are exposed to the wind or later acted upon by another force such automobile traffic, or particulate matter being thrown into the atmosphere by the operation of a bulldozer, material handling operations, etc...)

**Air Program Guidance / Requirements** Back to Menu

**Land Disturbance Air Permit Application(s)**
Under Colorado air quality regulations, land development refers to all land clearing activities, including but not limited to land preparation such as excavating or grading, for residential, commercial, or industrial development, or oil and gas exploration and production. Land development activities release fugitive dust, a pollutant regulated by the Air Pollution Control Division (Division) at the Colorado Department of Public Health and Environment.

1.) For projects lasting in duration for greater than 6 months, or have a total disturbed area of greater than 25 acres, proponents and/or contractors shall submit either a Land Development Air pollution Emissions Notice (LD APEN) or file for project inclusion under the State's General Permit.

2.) The links below provide an overview of the air pollution reporting and permitting requirements that may apply to land development activities.

- State Land Disturbance Permit Guidance.pdf
- Colorado Land Disturbance Permit Application / APEN.doc
- Copy of State General Permit

**ALL Construction Activities** Back to Menu
Regardless of the fact that a project is deemed exempt from Land Disturbance permitting requirements by the state, all construction activities are subject to the following regulations and controls.

1.) 20% opacity limit shall apply to all construction activities.

2.) No off-property transport emission limitation guidelines shall apply.

3.) Water and use controls as necessary to comply with the law.

**Paved Roads** Back to Menu

Any person who through operations or activities repeatedly deposits materials which may create fugitive particulate emissions on a public or private paved roadway is required to comply with the following to minimize such emissions;

1.) Gravel entryways shall be utilized to prevent mud and dirt carryout onto paved surfaces.

2.) Any mud or dirt tracked out onto paved surfaces shall be cleaned up daily.

**Storage and Handling of Materials** Back to Menu

Any owner or operator or any new or existing materials storage and handling operation from which fugitive particulate emissions will be emitted shall be required to comply with the following regulations and controls in order to minimize such emissions;

1.) 20% opacity limit shall apply to storage and handling of materials.

2.) No off-property transport emission limitation guidelines shall apply to storage and handling of materials.

3.) Water and use controls as necessary to comply with the law.

**Haul Roads** Back to Menu

FTC has a State enforceable Fugitive Dust Control Plan and a mandate to control emissions to the extent possible and practical from all dirt roads on the installation.

1.) Contractors which contribute significantly to trip counts (> 40 vehicles/day) along any section of the installation's dirt roads for hauling purposes will be required to assist in maintaining emissions control by watering to the extent that no nuisance emissions are created.

2.) Contractors shall adhere to posted speed limits on all roads at all times.

**Haul Trucks**

Any owner or operator of any new or existing haul trucks from which fugitive particulate emissions will be emitted shall be required to;

1.) Cover all loads when trucks are leaving the work site (work site is defined as the immediate construction area as defined by the permit or APEN application).

Back to Menu

**Sandblasting Operations**

Any owner or operator of any new or existing sandblasting activities from which fugitive particulate emissions will be emitted shall be required to;

1.) Comply with the 20% opacity emission limitation guideline.

2.) Use control methods inherent to the industry standards to comply with the law.

**Demolition Activities**

Employ watering to prevent potentially harmful construction debris and fine particulate matter from being transported off-site (off-site is defined as any property adjacent to the demolition property).

## Construction Activities (General Conformity Definition)

Back to Menu

For Federal actions a Conformity Determination is required for each pollutant where the total of direct and indirect emissions in a nonattainment or maintenance area caused by a Federal action would equal or exceed the applicable De Minimis or Regional Significance thresholds. 40 CFR 93.153(c) contains actions exempt from this requirement. A Record of Non-Applicability should be prepared for any action exempted, or where emissions are less than the above referenced significance thresholds.

## Air Program Guidance / Requirements

Back to Menu

### Conformity Reviews

All federal actions taking place within the Colorado Springs Carbon Monoxide Maintenance Area (FTC Cantonment Area) must undergo a General Conformity Analysis.

All planned projects, actions, and initiatives must be accurately captured and conveyed to the DPW-ED Air Program via the Air Quality Assessment (AQA) form. This information is required BEFORE the action begins so that the Air Program can complete the emissions analysis (if applicable) and document the conforming action via the Record of Non-Applicability (RONA), or one of the other methods as outlined in the reference CFR.

1.) Complete the AQA form. General exemptions are given for common conforming actions, that under the law do not require an emissions analysis. If the form button below is disabled then based on your input under the general project description, a conformity review is not required.

2.) Project Proponents are responsible for contacting the Air Program to inquire about the status of their action/project. Please allow up to 2 weeks after submission to complete the emissions analysis.

3.) In most cases projects will be exempt from the general conformity determination requirements. However the analysis must still be completed, and records must be maintained by the facility. In most circumstances this form will constitute the record of review.

## New Source Review (NSR) & Prevention of Significant Deterioration (PSD)

Back to Menu

Fort Carson must manage contemporaneous changes to potential emissions from the installation that would cause or could be defined as a major modification under PSD, trigger New Source Performance Standards (NSPS) for a listed source category, or require a construction permit under the states NSR rules.

## Air Program Guidance / Requirements

Back to Menu

### New Stationary Sources of External Combustion (ECU)

All new Boilers and H2O Heaters should be equipped or installed with certified Low NOx controls capable of reducing these exhaust gases to less than 30 ppm (corrected to 3% excess O2).

For H2O Heaters with heat inputs less than 400,000 btu/hr., the unit must be SCAQMD Rule 1146.2 certified and produce not more than 55 ppm of NOx (corrected to 3% excess O2).

Indirect Fired Make-up Air Units (MAU) should not be used on the installation since these units do not offer any emissions controls. Direct Fired MAUs may be used in limited circumstances but must be ANSI 83.4 or Z83.18 certified.

1.) All External Combustion Equipment installed, regardless of fuel type, must be reported to the DPW-ED Air Program via the equipment schedule portion of the Air Quality Assessment (AQA) form. This information is required BEFORE construction begins so that compliance, permitting, and modification (PSD) determinations can be made.

### New Stationary Sources of Internal Combustion (ICU) i.e. Engines

Back to Menu

All Internal Combustion Engines, emergency or otherwise, not previously existing on FTC must receive an Air Emissions Construction Permit prior to construction (defined as foundation installation). The Engine must be certified by the manufacturer to the appropriate emissions control tier, based on the size of the unit and the date of manufacture.

1.) All planned Internal Combustion Engines, regardless of fuel type and size, must be reported to the DPW-ED Air Program via the equipment schedule portion of the Air Quality Assessment (AQA) form. This information is required BEFORE construction begins so that Air Permit Applications can be submitted early enough to receive timely permits and not cause undue delay to the project construction schedules. **ALL UNITS CURRENTLY REQUIRE A PERMIT.**

**Other Stationary Sources of Criteria Pollutant Emissions**

Back to Menu

Any other sources of air pollution not specifically identified above must be reported to the air program for a regulatory determination. The determination will document the source type and the compliance status for the source well in advance of it's proposed operation. Examples of other sources include, parts washers and weapons cleaners, wood working shop tools, welding devices, paint booths, lab equipment, and any air pollution control devices to be connected to any existing or proposed piece of equipment.

1.) Provide initial details on the source via the AQA form.

## Ozone Depleting Substance & Refrigerant Containing Equipment

Back to Menu

The required production and use phase out of Class II Ozone Depleting Compounds (ODC) requires that new HVAC equipment manufacturers must utilize Non-ODC refrigerants for equipment manufactured after 1/1/2010. Given the useful life of the equipment and facilities they support, Fort Carson should avoid specifying and using any Class II substance (ex. R-22) containing equipment to avoid potentially costly material acquisitions in the future due to supply issues. ALL **Class I** (ex. R-12, Halon) refrigerants are strictly controlled by DoD. If Class I substances are used and / or discovered contact the Air Program immediately for the requirements!!!

## Air Program Guidance / Requirements

Back to Menu

### Refrigerant Types

HVAC equipment refrigerants should have an Ozone Depletion Potential of "0.0". Acceptable (HFC) refrigerant types include: R-23, R-134a, R-407a, b, & c, R-410a, & R-507.

DoD policy requires that ALL Class I and pure HCFC-22 (a Class II substance) must remain under DoD control at all times. Class I substances may not be stockpiled at an installation. Any portion not immediately used must be turned in to the ODC Strategic reserve. Pure HCFC-22 may be stored for use on installations or turned in to the ODC reserve.

1.) All ODS Containing Equipment installed, regardless of refrigerant type, must be reported to the DPW-ED Air Program via the equipment schedule portion of the Air Quality Assessment (AQA) form. This information is required so that compliance and registration determinations can be made.

2.) Any and all personnel engaging in any maintenance, repair, charging, or re-recharging, or any other activity upon any ODC containing equipment must be EPA certified, maintain records, and comply with 40 CFR parts 82 Subparts A, B, E, and F. This requirement is applicable to stationary and mobile assets, and is subject to enforcement under the Clean Air Act. 40 CFR Part 82 -- Protection of Stratospheric Ozone

3.) All records of certification and service (other than those of KIRA) shall be made available to Air Program personnel upon request. Any records obtained will remain on site as proof of compliance.

## Product Use Reporting

Back to Menu

Per condition 18.2 of the Fort Carson Title V Permit (95OPEP110), "Fort Carson shall track emissions of Hazardous Air Pollutants (HAPs) from all insignificant activities on a calendar year basis. Calculations shall be completed by April 30 for the previous calendar year. For mass balance calculations, the permit holder shall assume that the total HAP contained in the raw material used is emitted to the atmosphere. HAP content shall be determined from the specific Material Safety Data Sheets (MSDSs). Records of emission calculations and the MSDS shall be maintained by the permit holder and made available to the Division for inspection upon request. For the purposes of this condition, insignificant activities shall be defined as any activity or equipment which emits any amount of emissions but does not require an APEN (NOT the same as a Land development APEN).

## Air Program Guidance / Requirements

### Construction, Maintenance, Renovations, and Other Contracted Functions

Entities engaged in activities matching the description above must provide Fort Carson with a detailed accounting of all materials and products used to accomplish the activity or task. This information is required to comply with the Title V Permit, and maintain an Area Source status for Hazardous Air Pollutant (HAP) emissions.

**For ALL Projects:**

1.) **Reporting Scenario 1:** Provide an MSDS for ALL products used during the project. Report product units and amounts used on the 1st page of the MSDS.

2.) **Reporting Scenario 2:** Completely fill out the "Product Use" section of the Air Quality Assessment (AQA) form and provide the data to the Air Program at the conclusion of the project. The Air Program can then obtain a copy of the specific products' MSDS copy for our compliance calculations and records.

3.) **Reporting Frequency (All Scenarios):** For projects starting and concluding within the same calendar year (CY), Part B reporting will be due at the conclusion of the project. Multiyear projects shall report Part B data annually by no later than 1/30 for each subsequent calendar year the project extends into, and then submit final CY data immediately upon conclusion of the project.

Additional Comments / Data

Back to Instructions

Colorado Department of Public Health & Environment
Air Pollution Control Division

# NOTICE OF START-UP

THIRTY-DAY PRIOR NOTICE REQUIRED OF ALL NEW SOURCES

Even with a permit you cannot legally commence operation or conduct an activity for a new source until 30 days after you have notified the Division of the start-up date (Section 25-7-114.5(12)(a) of the Colorado Air Pollution Prevention and Control Act). In most cases, a permit is applied for and approved before the anticipated commencement date, so the 30 day prior notice causes no problems. ***Note: this form is not a Relocation Notice for portable sources.***

If, however you plan to commence your operation or activity as soon as you receive the permit, you should estimate the date you expect to commence (assuming the permit is approved) and fill out and return this form at least thirty days prior to that date. This will avoid a 30-day delay between receipt of the permit and commencement.

Notification can be accomplished by completing the form below and returning it to:

**Colorado Department of Public Health & Environment**
**APCD-SS-B1**
**4300 Cherry Creek Drive South**
**Denver, CO 80246-1530**

Please contact the Division immediately (303) 692-3150 if you have any questions or problems concerning this requirement.

**INSTRUCTIONS FOR THE COMPLETION OF THE**
**APPLICATION FOR CONSTRUCTION PERMIT OR PERMIT MODIFICATION FORM**

The following instructions for the completion of this form are titled, lettered, and numbered the same as the applicable sections of the form on the other side.

If a section does not apply, write "N/A": **DO NOT LEAVE BLANK**.

**NOTE:** All information submitted as part of this permit application and all data generated by the Division as part of processing this permit will be considered open to the public unless confidential treatment is requested in writing. All such materials **MUST** be (1) clearly marked "CONFIDENTIAL" and (2) enclosed in a **separate** sealed envelope marked "CONFIDENTIAL INFORMATION" to ensure against accidental release. Confidentiality is granted only if the release of such information would result in economic disadvantage to the applicant. If confidentiality is requested, the Division will notify you of its decision and, if denied, allow time for you to present additional evidence justifying the need for confidentiality. In general, confidentiality requests will increase permit processing time. Under no circumstances can emissions data be held confidential.

1. **PERMIT ISSUED TO:** List the name of the company (e.g., corporation, partnership, association, individual owner, or governmental agency) to whom the permit is to be issued and who will therefore be responsible for the operation of the source. This company name will be listed on the permit.

2. **MAILING ADDRESS:** This is the address for all correspondence relating to this permit.

3. **GENERAL NATURE OF BUSINESS:** List the business activity (dry cleaner, saw mill, furniture manufacturer, commercial printing, etc.). Also, list the Standard Industrial Classification (S.I.C.) for this type of business activity, if known.

4. **AIR POLLUTION SOURCE DESCRIPTION:** Provide a brief description of the equipment being permitted and the associated emission controls (e.g., concrete batch plant with baghouses, paint booth with particulate filters). If this source has an existing APCD permit(s), please list all applicable permit numbers.

5. **SOURCE ADDRESS:** Do not give a P.O. Box. This is for the physical location of the source. Please include a map that indicates the exact location and shows major topographic features. If the source is portable, include the home base and initial location.

6. **REASON FOR APPLICATION:**

   Modification of Permitted Source – A permit modification may be required for changes in emissions, throughput, equipment, etc.

   Request for Synthetic Minor –A source that is voluntarily applying for a permit to create federally enforceable permit conditions to limit the potential to emit criteria or hazardous air pollutants in order to avoid other requirements. Public comment must be conducted prior to the issuance of any synthetic minor emission permit.

   *Administrative Permit Amendments*

   Transfer of Ownership – A transfer of ownership is required if equipment previously permitted by another company has been purchased. A merger is considered to be a transfer of ownership. Complete sections 9 & 10 of this form.

   Name Change – A name change is appropriate if only the name on the permit is to be changed, and there is no transfer of ownership. Complete section 9 of this form.

   Other – Any other administrative change as defined in Regulation No. 3, Part A, Section I.B.1.

7. **PROJECTED START-UP DATE:** Construction, operation, or modifications prior to receipt of a permit is prohibited by Colorado Statute.

8. **DRAFT REVIEW REQUEST:** Review requests will usually add to both processing costs and processing time. Any additional time and charges incurred by the Division in providing a draft and correspondence with the applicant will be billed to the applicant. The Division will consider the request an official extension of the processing deadlines specified by the Act. The extension will consist of the number of days elapsed between Division mailing of the draft permit to the applicant and receipt of the applicant's comments by the Division, not to exceed 15 days. However, the Division is not bound to consider any comments received after the 15 day time period lapses, unless both the Division and the applicant agree to a further extension of the processing deadlines.

9. **PERMIT PREVIOUSLY ISSUED TO:** List the name of the company on the most recently issued permit. This section should be completed only if a company name change or transfer of ownership has occurred.

10. **TRANSFER OF OWNERSHP:** This section should be completed by the former owner of the permit. Transfer of the permit(s) conveys to the new owner all responsibility, coverage and liability associated with the permit(s). Submission of a transfer of ownership application without a request for permit modification implies that no change is contemplated which would constitute a new or modified air pollution source. A written agreement containing a specific date for transfer of ownership permit will be accepted in lieu of completion of this section of this form.

**Submit completed application, APENs, and filing fee to the address below:**

**APENS:** More than one Air Pollutant Emission Notice (APEN) may be needed with this application. Only one application form needs to be completed.

Multiple sources – An APEN is required for each source unless they may be grouped as specified in Regulation No. 3, Part A, Section II.B.4.

Transfer of Ownership – An APEN must be submitted for each individual emission source to be transferred.

Name Change – If a company is changing its name only, and all other procedures and information as stated in the last submitted APEN remains unchanged, then only one APEN for each facility is required.

**FEES:**

Filing Fee: Permittee must submit $119.96 per APEN with the application.

Permit Processing Fee: Permittee will be invoiced at the rate of $59.98 per hour based on the amount of time spent reviewing the application and issuing the permit. Invoices for APEN fees and permit processing fees must be paid before permit will be issued. Once an application is received, all processing time will be charged regardless of whether a permit is issued or not. If a project is cancelled, the division should be notified in writing immediately.

Annual Fees: Annual fees will be billed for each source requiring an APEN to cover the costs of periodic inspections and administration. Annual fees are based on the quantity and type of pollutants emitted. For specific information related to fees see Regulation No. 3, Part A, Section VI.

Mail completed application, APENs, and filing fee to:

Colorado Department of Public Health and Environment

## Air Pollutant Emission Notice (APEN) – and – Application for Construction Permit

☐ New Facility ☐ Transfer of Ownership * ☐ Change in Production ☐ No Change (APEN Update Only)

All sections of this APEN and application must be completed prior to submittal to the Division for both new and existing facilities. An application with missing information may be determined incomplete and may result in longer engineer processing times.

* Note: For transfer of ownership or company name change of a permit, you must also submit a Construction Permit Application form.

**Permit Number** _____ **AIRS Number** _____

Company Name: _____

## FUGITIVE DUST CONTROL PLAN FOR LAND DEVELOPMENT

(This must be submitted with the Air Pollutant Emission Notice-and-Application for Emission Permit)

Regulation No. 1 requires that a fugitive dust control plan be submitted by applicants whose source / activity results in fugitive dust emissions. The control plan must enable the source to minimize emissions of fugitive dust to a level that is technologically feasible and economically reasonable. If the control plan is not adequate in minimizing emissions a revised control plan may be required. The control plan (if acceptable to the Division) will be used for enforcement purposes on the sources.

Please check the dust control measures which you propose for your activity. The Division will enforce the control measures checked. Use separate sheets if more space is needed. Also note items with an asterisk (*). This indicates those measures which will probably be required.

**I**. Control of Unpaved Roads on Site

- ☐ Watering
  - ☐ Frequent (Watering Frequency of 2 or More Times Per Day)
  - ☐ As Needed
- ☐ Application of Chemical Stabilizer
- ☐ Vehicle Speed Control
  Speeds limited to _____ mph maximum. Speed limit signs must be posted.
  (Generally 30 mph is maximum approvable speed on site.)
- ☐ Gravelling

**II**. Control of Disturbed Surface Areas on Site

- ☐ Watering
  - ☐ Frequent (Watering Frequency of 2 or More Times Per Day)
  - ☐ As Needed
- ☐ Application of Chemical Stabilizer
- ☐ Vehicle Speed Control
  Speeds Limited To _____ MPH Maximum. Speed Limit Signs Must Be Posted.
- ☐ Revegetation Revegetation Must Occur Within One Year Of Soil Disturbance
  - ☐ Seeding with mulch
  - ☐ Seeding without mulch
- ☐ Furrows at right angle to prevailing wind
  Depth of furrows _____ Inches (must be greater than 6")
- ☐ Compaction Of Disturbed Soil On A Daily Basis To Within 90 % Of Maximum Compaction
  (As determined by a Proctor Test).
  - ☐ Foundation areas only; or
  - ☐ All disturbed soil.
- ☐ Wind Breaks
  Type: _____ (Example: Snow Fence, Silt Fence, etc.)
- ☐ Synthetic Or Natural Cover For Steep Slopes.
  Type: _____ (Netting, Mulching, etc.)

## - LAND DEVELOPMENT -

**III**. Prevention Of Mud And Dirt Carried Out Onto Paved Surfaces.

☐ Prevention
- ☐ Gravel Entry Ways
- ☐ Washing Vehicle Wheels
- ☐ Other: _____

☐ Cleanup of Paved Areas Frequency: _____ Times Per Day
- ☐ Street Sweeper
- ☐ Hose With Water
- ☐ Other: _____

**Additional Sources of Emissions**

List any other sources of emissions or control methods

## SUMMARY OF CHANGES

(Excludes general format changes, error corrections, and omissions)

1.) El Paso County repealed their fugitive dust permit requirements in 2009 and reinstated the requirements and regulations effective 2012. The El Paso County specific fugitive dust reporting requirements have been included for completeness.

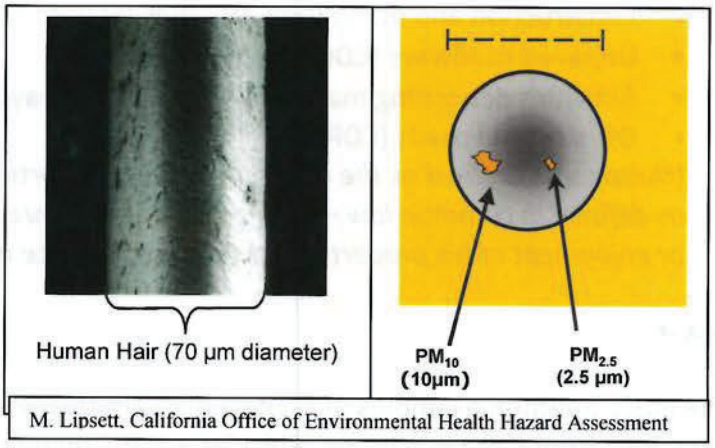
## SECTION 1 – INTRODUCTION

TOC

### *Purpose*

The Colorado Department of Public Health and Environment (CDPHE) Air Quality Control Commission (AQCC) Regulation No. 1 (5 Colorado Code of Regulations 1001-3) Part III.D establishes requirements for control of fugitive particulate emissions. Developed at the request of the CDPHE, this plan describes all of the fugitive dust sources and the technologically feasible and economically reasonable control measures and operating procedures that can be used to minimize dust on Fort Carson. **Our personnel, contractors, and Soldiers will implement these measures to avoid off-property transport and to ensure the associated visible emissions do not exceed 20% opacity or create a nuisance problem.** Additionally, this plan will serve as a planning tool that can be incorporated into project design and construction phases to help reduce fugitive dust emissions on Fort Carson. CDPHE can cite a violation of Regulation 1 if Fort Carson fails to comply with the provisions of this Plan.

### *Fugitive Dust and Its Health Effects*



Fugitive dust is a health concern because it can contain particles that may be trapped in the nose or upper respiratory system. Other particles can bring about both chronic and acute health effects, such as persistent coughs, asthma, aggravation of bronchitis, premature death, or heart and lung disease. Particularly sensitive groups that appear to be at greater risk include the elderly, individuals with cardiopulmonary disease (such as asthma), and children. In addition to health complications, material in fugitive dust can cause impaired vision, physical discomfort and/or property damage.

### *References*

Fort Carson is regulated by the CDPHE for any activities that create fugitive dust emissions under AQCC Regulation No. 1. Certain activities, such as sandblasting and land development projects, may require permits and if so, the permits will contain site-specific fugitive dust control plans. Refer to the Colorado Land Development Application Guidance for projects requiring a Construction Activity or Land Development permit based on the size or duration of disturbed land. The Directorate of Public Works Environmental Division (DPW-ED) Air Program Air Quality Assessment (AQA) Form also address fugitive dust control. The applicable State emission limitation guidelines for submission of a control plan are listed below. Also include here for reference are additional El Paso County requirements for control of fugitive dust.

## SECTION 2 – SOURCE CATEGORIES

TOC

### *General*

This section defines and describes the fugitive dust emissions sources on Fort Carson. Fugitive emissions are those that cannot be reasonably collected and passed through a stack or other type of opening. When they are caused by sporadic or widespread activities due to wind or vehicle travel, it can often be difficult to quantify such emissions. Fort Carson's annual emissions inventory includes fugitive dust emissions from unpaved roads; however, this is a rough estimate as it is difficult to track the number and types of vehicles on these roads, located mostly downrange from the cantonment area. Additionally, there are no specific emission factors established for the various types of military vehicles or to account for Colorado's soil conditions.

### *Potential Source Categories on Fort Carson*

- Construction/Land Development Activities
- Demolition Activities (Applicable to Non-Attainment Areas, only)
- Storage Yards, Storage Piles
- Haul Roads
- Unpaved Road Travel
- Unpaved Road Wind Erosion
- Paved Road Dust Entrainment
- Sandblasting
- Disturbed Areas
- Street Cleaning/Sweeping
- Street Sanding
- Mining Activities

*Construction/Land Development Activities*

This is a significant windblown fugitive dust category on Fort Carson. This category represents dust generated by soil disturbance due to surface preparation and equipment use. Windy conditions greatly increase emissions from disturbed surfaces. Construction activities include excavations, grading, filling, and other earth moving by mechanical processes that may result in releasing dust into the atmosphere. Projects may include, but are not limited to, constructing gate entrances and buildings, developing parking lots and roads, and excavations of ditches.

*Demolition, Dismantling, and Renovation Activities*

Demolition activities include the destruction or dismantling of a structure by using mechanical equipment, such as bulldozers, front-end loaders, or cranes. Debris from demolition practices is loaded onto trucks, which can create dust, and transported to an off-post permitted landfill. Projects

*Street Cleaning/Sweeping*

Mechanical street sweepers are used on a continuous basis on Fort Carson. They clean the debris from paved roadways to maintain the overall appearance of Fort Carson and also as a best management practice for storm water pollution control. However, in dry conditions, the sweeping equipment can create some minor, localized dust emissions.

*Street Sanding*

This is a seasonal source as sand is applied on icy roads in the wintertime to improve driving conditions and to protect public safety. However, the sand left on the roads can become windblown or be disturbed and ground-up by vehicle traffic, thus contributing relatively small amounts of localized dust emissions.

*Mining Activities*

Brown's Quarry is currently used as a training site for engineer military equipment such as earth movers, etc, however the potential for mining activities to occur in the future at the site exists. The Tomahawk Mine and the Stone City Mine, on Fort Carson near Stone City in Pueblo County, are actively permitted and mined for clay by General Shale Brick Inc., which has state-owned mineral rights. (Fort Carson does not manage any permitting for this source.) The Wild Horse Quarry is also located on Fort Carson near Stone City. It is an intermittent status mine for sand and gravel (operates less than 180 days per year) and is permitted under the 4Id Headquarters through DPW-ED.

opportunities for using such practices if they are not included in the list below. Per Fort Carson Regulation 350-11, the speed limit for tactical vehicles is 30 mph on numbered routes, and 20 mph on unimproved trails, while for non-tactical vehicles the speed limit is 40 mph on Route 1 and 30 mph for unpaved roads.

*Construction/Land Development Activities*

- Use water for short-term surface stabilization (chemical stabilization maybe necessary)
- Minimize track-out onto paved roads
- Cover materials in the haul trucks
- Wash loaded haul trucks to remove materials from the exterior prior to transporting materials
- Wet the load
- Limit load size
- Stabilize site upon completion of grading (using either chemical, mechanical or vegetation) or when subsequent development is delayed
- Obey speed limits
- Rapid cleanup of project-related track-out or material spills on paved roads
- Maintain natural topography to the greatest extent possible
- Construct parking lots and paved roads first (where feasible)
- Construct upwind portions of projects first (where feasible)
- Restrict activity during periods of high winds
- Close roads if necessary

*Demolition, Dismantling, and Renovation Activities*

Control measures shall be used throughout the demolition and cleanup portion of the project, including during loading and transit of materials.

- Wet down, including pre-wetting of work surface
- Use of appropriate containment
- Minimize track-out onto paved roads
- Cover materials in haul trucks
- Wash loaded haul trucks to remove materials from the exterior prior to transporting materials
- Wet the load
- Limit load size
- Rapid cleanup of project-related track-out or material spills on paved roads
- Restrict activity during periods of high winds

*Storage Yards and Storage Piles*

- Use of wind breaks

*Paved Road Dust Entrainment*

- Minimize track-out onto paved roads
- Cover materials in haul trucks
- Limit load size
- Rapid cleanup of project-related track-out or material spills on paved roads
- Employ street cleaning/sweeping
- Wash or otherwise treating the exterior of the vehicle
- Keep roadway access point free of materials that may be carried onto the roadway
- Obey speed limits

*Abrasive blasting*

This is an occasional source on Fort Carson and must be coordinated with the DPW-ED prior to implementing such outdoor projects to ensure that the appropriate sampling and analysis is performed on the paint in case it contains lead. (Abrasive blasting of vehicles is performed indoors at Building 8004.)

- Use enclosures with dust collecting equipment
- Use wet blasting methods
- Use non-silica blast media

*Disturbed Areas*

- Use water for short-term surface stabilization
- Stabilize site upon completion of grading (using either (chemical, mechanical or vegetation) or when subsequent development is delayed
- Reseed
- Compact disturbed soil
- Use wind breaks
- Use weed suppression techniques, such as mowing weeds or using goats

*Street Cleaning/Sweeping*

- Use water while equipment is operated
- Clean streets on a regular schedule to avoid build up

*Street Sanding*

- Sand streets by priority for public safety
- Thoroughly remove sand as soon as possible after a storm to prevent it from being ground into dust (street cleaning/sweeping)

## SECTION 4 – RESPONSIBILITIES

TOC

Personnel involved in activities that produce fugitive dust emissions will continue to be made aware of applicable local, state and federal regulations by providing them access to this plan and receiving DPW-ED Air Program comments on project reviews. Regardless of whether or not a permit is required, sources potentially emitting fugitive dust are required to minimize such emissions so that nuisance conditions are not created, visible emissions are not transported off property, and opacity limits are not exceeded.

Dust issues related to military training are addressed during the EPO training course and at the periodic Environmental Quality Working Group (EQWG) meeting general, dust issues are addressed relating to how to monitor dust on sites, actions to take if a non-compliance event occurs, and where to find this plan. In addition, the DPW-ED Air Program will address current particulate matter/dust issues at the Garrison Commanders Environmental Quality Control Committee (EQCC) to raise awareness of dust challenges and consider policy actions. Dust issues are also addressed during Fort Carson's NEPA review process through the use of the AQA form. Each project is reviewed and if needed an AQA form and this Fugitive Dust Control Plan is provided. DPW-ED efforts to increase education and awareness about dust concerns should minimize the potential for non-compliance issues concerning dust on Fort Carson.

If a fugitive dust event exceeds the 20% opacity limit, results in off-property transport or violates the nuisance regulation, actions will be taken to correct the problem and return to compliance as quickly as possible. Project proponents/contractors are responsible for complying with their specific county/state dust control plans, if a permit is required, as well as the Fugitive Dust Control Plan. If the contractor is not implementing sufficient control measures, then the Contracting Officer Representative must take appropriate future actions, e.g., stop awarding projects to that contractor etc.

The following are steps that have been and will continue to be taken if a fugitive dust event is observed by project proponents/contractors:

- Stop the activity immediately.
- Within a reasonable timeframe, notify DPW-ED Air Program by phone (526-6601) and if no one is there, contact the DPW-ED Compliance Branch at 526-1694.
- Proceed with activity in conjunction with DPW-ED guidance.
- Implement more control measures to minimize the fugitive dust non-compliance event.
- Provide DPW-ED Air Program with situational updates.

The DPW-ED Air Program will take the following steps if a fugitive dust non-compliance event occurs:

## SECTION 5 – CONCLUSION

TOC

This plan should be referred to prior to project initiation to provide additional forethought in the development and implementation of a project to avoid off-property transport and to ensure the associated visible emissions do not exceed 20% opacity or create a nuisance problem. Personnel involved in activities that produce fugitive dust are responsible for implementing the applicable control measures and operating procedures to minimize dust emissions to the greatest extent possible. Such persons are responsible for complying with all applicable county, state and federal air regulations and will appropriately burden the responsibility of any associated compliance actions if taken by the regulatory authorities.

Personnel will continue to be made aware of the local and state regulations through a variety of ways, primarily by being provided access to this plan. The DPW-ED Air Program will continue providing appropriate comments when reviewing projects via the NEPA process so that personnel will be made aware of fugitive dust issues and requirements for control measures.

## Appendix B—El Paso County Air Permitting Requirements For Construction Activities

TOC

Applicability of the El Paso County permitting process is not based on project size, but area of land disturbed and time taken to disturb it.

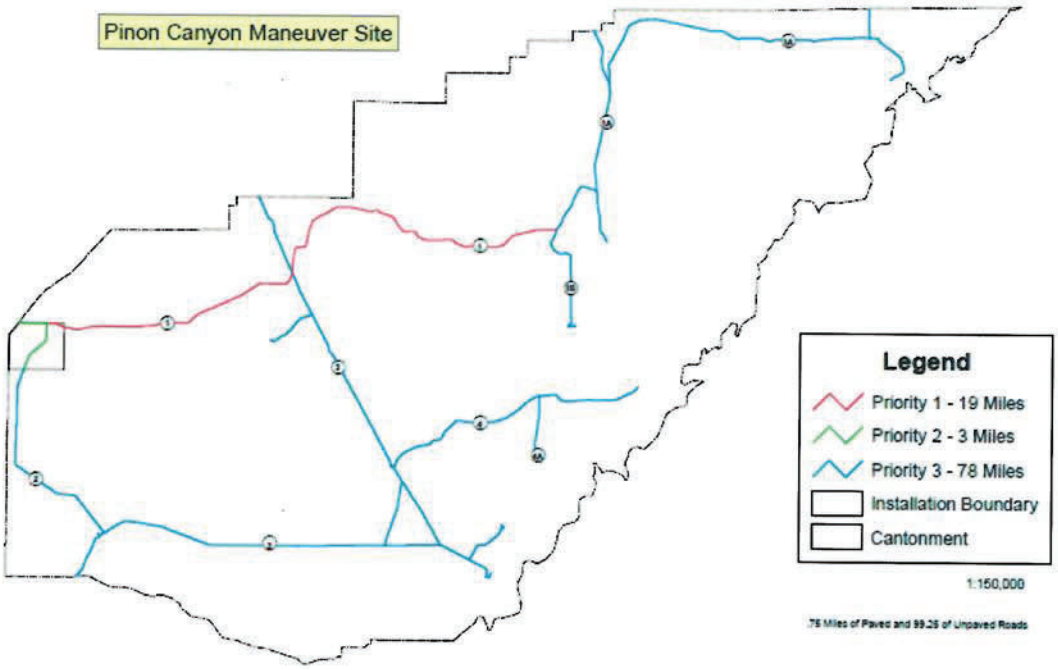
An application for the Construction Activity Permit shall be made to El Paso County Public Health when:

- Construction activities will not exceed six (6) months in duration, and;
- Land development is equal to or greater than one (1) acre, but less than twenty-five (25) acres.[1]

If the project meets the standards listed above, an El Paso County Construction Activities permit is required.[2]

[1] limit = contiguous acreage.

[2] Complete and submit El Paso County permit application.



Pinon Canyon Maneuver Site
Legend
Priority 1 - 19 Miles
Priority 2 - 3 Miles
Priority 3 - 78 Miles
Installation Boundary
Cantonment
1:150,000
78 Miles of Paved and 99.26 of Unpaved Roads

# 2017 CGP Construction SWPPP Template

**Instructions**

To help you develop your construction project Stormwater Pollution Prevention Plan (SWPPP), the U.S Environmental Protection Agency (EPA) has created this SWPPP Template. The template is designed to help you develop a SWPPP that is compliant with the minimum requirements of EPA's 2017 Construction General Permit ("2017 CGP"), and is customizable to your specific project and site.

**Using the SWPPP Template**

Each section of the SWPPP Template includes "instructions" and space for your project and site information. You should read the instructions for each section before you complete that section. The SWPPP Template was developed as an editable document file so that you can easily add tables and additional text, and delete unneeded or non-applicable fields. Note that some sections may require only a brief description while others may require several pages of explanation.

The following tips for using this template will help you ensure that the minimum permit requirements are met:

- Read the 2017 CGP thoroughly before you begin preparation of your SWPPP to ensure that you have a working understanding of the permit's underlying requirements. You will also need to consult Part 9 of the permit to determine if your state or tribe has included additional requirements that affect you.
- Complete the SWPPP prior to submitting your Notice of Intent (NOI) for permit coverage. This is required in Parts 1.4 and 7.1.1.
- If you prepared a SWPPP for coverage under a previous version of EPA's CGP, you must review and update your SWPPP to ensure that the 2017 CGP requirements are addressed prior to submitting your NOI.

  *Note: If your project is an "existing project" (see Part 1.4.2.b) or if you are a "new operator of an existing project" (see Part 1.4.2.c), and it is infeasible for you to comply with a specific requirement in Part 2.1 and 2.3.3 through 2.3.5 of the permit (except for Parts 2.3.3.1, 2.3.3.2b, 2.3.3.3c.i, and 2.3.3.4) because (1) the provision was not part of the permit you were previously covered under (i.e., the 2003 or 2008 CGP), and (2) because you are prevented from compliance due to the nature or location of earth disturbances that commenced prior to February 16, 2017, or because you are unable to comply with the requirement due to the manner in which stormwater controls have already been installed or were already designed prior to February 16, 2017, you are required to include documentation in your SWPPP of the reasons why it is infeasible for you to meet the specific requirement, and then you may be waived from complying with the requirement. You must include a separate justification why it is infeasible for you to meet each of the applicable requirements.*

- If there is more than one construction operator for your project, consider coordinating development of your SWPPP with the other operators. However, while multiple operators may share the same SWPPP, make sure that responsibilities and scope of work are clearly described for each operator.
- Once you have been provided coverage under the CGP, include your NOI and authorization email, as well as a copy of the CGP, as attachments to the SWPPP. See Appendices B and C of the SWPPP Template.

EPA notes that while EPA has made every effort to ensure the accuracy of all instructions and guidance contained in the SWPPP Template, the actual obligations of regulated construction activities are determined by the relevant provisions of the permit, not by the Template. In the event of a conflict between the SWPPP Template and any corresponding provision of the 2017 CGP, you must abide by the requirements in the permit. EPA welcomes comments on the SWPPP Template at any time and will consider those comments in any future revision of this document. You may contact EPA for CGP-related inquiries at cgp@epa.gov.

## SECTION 1: CONTACT INFORMATION/RESPONSIBLE PARTIES

### *1.1 Operator(s) / Subcontractor(s)*

**Instructions (see definition of "operator" at CGP Part 1.1.1):**

- Identify the operator(s) who will be engaged in construction activities at the site. Indicate respective responsibilities, where appropriate. Also include the 24-hour emergency contact.
- List subcontractors expected to work on-site. Notify subcontractors of stormwater requirements applicable to their work.
- Consider using Subcontractor Agreements such as the type included as a sample in Appendix G of the Template.

**Operator(s):**

Insert Company or Organization Name:
Insert Name:
Insert Address:
Insert City, State, Zip Code:
Insert Telephone Number:
Insert Fax/Email:
Insert area of control (if more than one operator at site):

[Repeat as necessary.]

**Subcontractor(s):**

Insert Company or Organization Name:
Insert Name:
Insert Address:
Insert City, State, Zip Code:
Insert Telephone Number:
Insert Fax/Email:
Insert area of control (if more than one operator at site):

[Repeat as necessary.]

**Emergency 24-Hour Contact:**

Insert Company or Organization Name:
Insert Name:
Insert Telephone Number:

### *1.2 Stormwater Team*

**Instructions (see CGP Part 7.2.2):**

- Identify the staff members (by name or position) that comprise the project's stormwater team as well as their individual responsibilities. At a minimum the stormwater team is comprised of individuals who are responsible for overseeing the development of the SWPPP, any later modifications to it, and for compliance with the requirements in this permit (i.e., installing and maintaining stormwater controls, conducting site inspections, and taking corrective actions where required).
- Each member of the stormwater team must have ready access to either an electronic or paper copy of applicable portions of the 2017 CGP and your SWPPP.

***Delegation of Authority (see CGP Appendix 11).***

- Identify the individual(s) or positions within the company who have been delegated authority to sign inspection and corrective action reports, and SWPPP modifications.
- Attach a copy of the signed delegation of authority (see example in Appendix J of the Template.

Insert Role or Responsibility:
Insert Position:
Insert Name:
Insert Telephone Number:
Insert Email:

Insert Role or Responsibility:
Insert Position:
Insert Name:
Insert Telephone Number:
Insert Email:

Insert Role or Responsibility:
Insert Position:
Insert Name:
Insert Telephone Number:
Insert Email:

[Repeat as necessary.]

## SECTION 2: SITE EVALUATION, ASSESSMENT, AND PLANNING

### *2.1 Project/Site Information*

**Instructions (see "Project/Site Information" section of Appendix J – NOI form):**

- In this section, you are asked to compile basic site information that will be helpful to you when you file your NOI.
- Detailed information on determining your site's latitude and longitude can be found at www.epa.gov/npdes/stormwater/latlong

#### 2.1.1. Project Name and Address

Project/Site Name: INSERT TEXT HERE
Project Street/Location: INSERT TEXT HERE
City: INSERT TEXT HERE
State: INSERT TEXT HERE
ZIP Code: INSERT TEXT HERE
County or Similar Subdivision: INSERT TEXT HERE

#### 2.1.2. Project Latitude/Longitude

(Use **one** of three possible formats, and specify method)

| Latitude: | Longitude: |
|---|---|
| 1. _ _ ° _ _ ' _ _" N (degrees, minutes, seconds) | 1. _ _ ° _ _ ' _ _" W (degrees, minutes, seconds) |
| 2. _ _ ° _ _ . _ _' N (degrees, minutes, decimal) | 2. _ _ ° _ _ . _ _' W (degrees, minutes, decimal) |
| 3. _ _ . _ _ _ _ ° N (decimal) | 3. _ _ . _ _ _ _ ° W (decimal) |

Method for determining latitude/longitude:
☐ USGS topographic map (specify scale: _____) ☐ EPA Web site ☐ GPS
☐ Other (please specify):

_____

Horizontal Reference Datum:
☐ NAD 27 ☐ NAD 83 or WGS 84 ☐ Unknown

If you used a U.S.G.S topographic map, what was the scale?

_____

_____

#### 2.1.3. Additional Project Information

Is the project/site located on Indian country lands, or located on a property of religious or cultural significance to an Indian tribe? ☐ Yes ☐ No

If yes, provide the name of the Indian tribe associated with the area of Indian country (including the name of Indian reservation if applicable), or if not in Indian country, provide the name of the Indian tribe associated with the property: INSERT TEXT HERE

If you are conducting earth-disturbing activities in response to a public emergency, document the cause of the public emergency *(e.g., natural disaster, extreme flooding conditions)*, information substantiating its occurrence *(e.g., state disaster declaration)*, and a description of the construction necessary to reestablish effective public services: INSERT TEXT HERE

Are you applying for permit coverage as a "federal operator" as defined in Appendix A of the 2017 CGP? ☐ Yes ☐ No

### *2.2 Discharge Information*

**Instructions (see "Discharge Information" section of Appendix J – NOI form):**

- In this section, include information relating to your site's discharge. This information corresponds to the "Discharge Information" section of the NOI form. Because you may be using EPA's mapping tool to answer some of these questions, and the tool is accessed in the eNOI system, you may find it necessary to leave some questions unanswered until you have completed that portion of the NOI.
- For Table 1, list the name of the first surface water that receives discharges from your site. If your site has discharges to multiple surface waters, indicate the names of all such waters.
- For Table 2, if any of the surface waters you listed out in Table 1 are listed as impaired by the applicable State or Tribe, provide specified information about pollutants causing the impairment and whether or not a Total Maximum Daily Load (TMDL) has been completed for the surface water. For more information on TMDLs and impaired waters, including a list of TMDL contacts and links by state, visit www.epa.gov/npdes/stormwater/tmdl.
- For Table 3, indicate whether any of the surface waters you listed out in Table 1 are designated as Tier 2, 2.5, or 3 waters by your State or Tribe. See Appendix F for more information.

Does your project/site discharge stormwater into a Municipal Separate Storm Sewer System (MS4)? ☐ Yes ☐ No

Are there any surface waters that are located within 50 feet of your construction disturbances?
☐ Yes ☐ No

**Table 1 – Names of Receiving Waters**

| Name(s) of the first surface water that receives stormwater directly from your site and/or from the MS4 (note: multiple rows provided where your site has more than one point of discharge that flows to different surface waters) |
|---|
| **1. Fountain Creek** |
| **2.** |
| **3.** |
| **4.** |
| **5.** |
| **6.** |

[Include additional rows as necessary.]

**Table 2 – Impaired Waters / TMDLs** (Answer the following for each surface water listed in Table 1 above)

| | Is this surface water listed as "impaired"? | If you answered yes, then answer the following: | | | |
|---|---|---|---|---|---|
| | | What pollutant(s) are causing the impairment? | Has a TMDL been completed? | Title of the TMDL document | Pollutant(s) for which there is a TMDL |
| **1.** | ☒ YES ☐ NO | **E. Coli** | ☐ YES ☐ NO | | |
| **2.** | ☐ YES ☐ NO | | ☐ YES ☐ NO | | |
| **3.** | ☐ YES ☐ NO | | ☐ YES ☐ NO | | |
| **4.** | ☐ YES ☐ NO | | ☐ YES ☐ NO | | |
| **5.** | ☐ YES ☐ NO | | ☐ YES ☐ NO | | |
| **6.** | ☐ YES ☐ NO | | ☐ YES ☐ NO | | |

[Include additional rows as necessary.]

Describe the method(s) you used to determine whether or not your project/site discharges to an impaired water: INSERT TEXT HERE

**Table 3 – Tier 2, 2.5, or 3 Waters** (Answer the following for each surface water listed in Table 1 above)

| | Is this surface water designated as a Tier 2, Tier 2.5, or Tier 3 water? (see Appendix F) | If you answered yes, specify which Tier (2, 2.5, or 3) the surface water is designated as? |
|---|---|---|
| **1.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |
| **2.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |
| **3.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |
| **4.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |
| **5.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |
| **6.** | ☐ YES ☐ NO | INSERT "Tier 2", "Tier 2.5", or "Tier 3" |

## *2.3 Nature of the Construction Activity*

**Instructions (see CGP Parts 7.2.3):**

- Provide a general description of the nature of the construction activities at your project.
- Describe the size of the property (in acres) and the total area expected to be disturbed by the construction activities (in acres), construction support activities covered by this permit (see Part 1.3.c of the permit), and the maximum area expected to be disturbed at any one time.

### 2.3.1. General Description of Project

Provide a general description of the construction project:

INSERT TEXT HERE

### 2.3.2. Size of Construction Project

What is the size of the property (in acres), the total area expected to be disturbed by the construction activities (in acres), and the maximum area expected to be disturbed at any one time?

INSERT SIZE OF PROPERTY (in acres)

INSERT TOTAL AREA OF CONSTRUCTION DISTURBANCES (in acres)

INSERT MAXIMUM AREA TO BE DISTURBED AT ANY ONE TIME (in acres)

[Repeat as necessary for individual project phases.]

### 2.3.3. Construction Support Activities (only provide if applicable)

Describe any construction support activities for the project (e.g., concrete or asphalt batch plants, equipment staging yards, material storage areas, excavated material disposal areas, borrow areas)

INSERT DESCRIPTION OF CONSTRUCTION SUPPORT ACTIVITY

INSERT CONTACT INFORMATION FOR CONSTRUCTION SUPPORT ACTIVITY (Name, Telephone No., Email Address)

INSERT LOCATION INFORMATION FOR CONSTRUCTION SUPPORT ACTIVITY (Address and/or Latitude/Longitude)

[Repeat as necessary.]

**2.3.4. Business Day and Hours.** Provide the expected working days and hours for the project.

### *2.4 Sequence and Estimated Dates of Construction Activities*

**Instructions (see CGP Part 7.2.3.f):**

- Describe the intended construction sequence and timing of major activities.
- For each phase of construction, include the following information:
  - ✓ Installation of stormwater controls, and when they will be made operational;
  - ✓ Commencement and duration of earth-disturbing activities, including clearing and grubbing, mass grading, site preparation (i.e., excavating, cutting and filling), final grading, and creation of soil and vegetation stockpiles requiring stabilization;
  - ✓ Cessation, temporarily or permanently, of construction activities on the site, or in designated portions of the site;
  - ✓ Final or temporary stabilization of areas of exposed soil. The dates for stabilization must reflect the applicable deadlines to which you are subject to in Part 2.2.1; and
  - ✓ Removal of temporary stormwater conveyances/channels and other stormwater control measures, removal of construction equipment and vehicles, and cessation of any pollutant-generating activities.
- The construction sequence must reflect the following requirements:
  - ✓ Part 7.2.3.b/c/d (area of disturbance);
  - ✓ Part 7.2.3.f (installation of stormwater controls); and
  - ✓ Parts 7.2.3.f (stabilization deadlines).
- Also, see EPA's *Construction Sequencing BMP Fact Sheet* at http://www.epa.gov/npdes/stormwater/menuofbmps/construction/cons_seq)

**Phase I**

INSERT GENERAL DESCRIPTION OF PHASE

- INSERT ESTIMATED START AND END DATES OF CONSTRUCTION DISTURBANCES ASSOCIATED WITH THIS PHASE
- FOR EACH STORMWATER CONTROL, INSERT ESTIMATED DATE(s) OF INSTALLATION OF EACH STORMWATER CONTROL
- FOR AREAS OF THE SITE REQUIRED TO BE STABILIZED, INSERT ESTIMATED DATE(s) OF APPLICATION OF STABILIZATION MEASURES
- INSERT ESTIMATED DATE(s) WHEN STORMWATER CONTROLS WILL BE REMOVED

**Phase II**

INSERT GENERAL DESCRIPTION OF PHASE

- INSERT ESTIMATED START AND END DATES OF CONSTRUCTION DISTURBANCES ASSOCIATED WITH THIS PHASE
- FOR EACH STORMWATER CONTROL, INSERT ESTIMATED DATE(s) OF INSTALLATION OF EACH STORMWATER CONTROL
- FOR AREAS OF THE SITE REQUIRED TO BE STABILIZED, INSERT ESTIMATED DATE(s) OF APPLICATION OF STABILIZATION MEASURES
- INSERT ESTIMATED DATE(s) WHEN STORMWATER CONTROLS WILL BE REMOVED

[Repeat as needed.]

## *2.5 Allowable Non-Stormwater Discharges*

**Instructions (see CGP Parts 1.2.2 and 7.2.5):**

- Identify all allowable sources of non-stormwater discharges. The allowable non-stormwater discharges identified in Part 1.2.2 of the 2017 CGP include:
  - ✓ Discharges from emergency fire-fighting activities;
  - ✓ Fire hydrant flushings;
  - ✓ Landscape irrigation;
  - ✓ Waters used to wash vehicles and equipment, provided that there is no discharge of soaps, solvents, or detergents used for such purposes;
  - ✓ Water used to control dust;
  - ✓ Potable water including uncontaminated water line flushings;
  - ✓ Routine external building wash down that does not use detergents;
  - ✓ Pavement wash waters provided spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and detergents are not used. You are prohibited from directing pavement was waters directly into any surface water, storm drain inlet, or stormwater conveyance, unless the conveyance is connected to a sediment basin, sediment trap, or similarly effective control;
  - ✓ Uncontaminated air conditioning or compressor condensate;
  - ✓ Uncontaminated, non-turbid discharges of ground water or spring water;
  - ✓ Foundation or footing drains where flows are not contaminated with process materials such as solvents or contaminated ground water; and
  - ✓ Construction dewatering water that has been treated by an appropriate control.

### 2.5.1. List of Allowable Non-Stormwater Discharges Present at the Site

| Type of Allowable Non-Stormwater Discharge | Likely to be Present at Your Site? |
|---|---|
| Discharges from emergency fire-fighting activities | ☐ YES ☐ NO |
| Fire hydrant flushings | ☐ YES ☐ NO |
| Landscape irrigation | ☐ YES ☐ NO |
| Waters used to wash vehicles and equipment | ☐ YES ☐ NO |
| Water used to control dust | ☐ YES ☐ NO |
| Potable water including uncontaminated water line flushings | ☐ YES ☐ NO |
| Routine external building wash down | ☐ YES ☐ NO |
| Pavement wash waters | ☐ YES ☐ NO |
| Uncontaminated air conditioning or compressor condensate | ☐ YES ☐ NO |
| Uncontaminated, non-turbid discharges of ground water or spring water | ☐ YES ☐ NO |
| Foundation or footing drains | ☐ YES ☐ NO |
| Construction dewatering water | ☐ YES ☐ NO |

(Note: You are reminded of the requirement to identify the likely locations of these allowable non-stormwater discharges on your site map. See Section 2.6, below, of the SWPPP Template.)

## *2.6 Site Maps*

**Instructions (see CGP Part 7.2.4):**

– Attach site maps in Appendix A of the Template. For most projects, a series of site maps is necessary and recommended. The first should show the undeveloped site and its current features. An additional map or maps should be created to show the developed site or, for more complicated sites, show the major phases of development.

**These maps must include the following features:**

- Boundaries of the property;
    - Locations where construction activities will occur, including:
    - Locations where earth-disturbing activities will occur (note any phasing), including any demolition activities;
    - Approximate slopes before and after major grading activities (note any steep slopes (as defined in Appendix A));
    - Locations where sediment, soil, or other construction materials will be stockpiled;
    - Any water of the U.S. crossings;
    - Designated points where vehicles will exit onto paved roads;
    - Locations of structures and other impervious surfaces upon completion of construction; and
- Locations of on-site and off-site construction support activity areas covered by this permit (see Part 1.2.1c).
- Locations of all waters of the U.S. within and one mile downstream of the site's discharge point. Also identify if any are listed as impaired, or are identified as a Tier 2, Tier 2.5, or Tier 3 water;
- Areas of federally listed critical habitat within the site and/or at discharge locations;
- Type and extent of pre-construction cover on the site (*e.g., vegetative cover, forest, pasture, pavement, structures*);
- Drainage patterns of stormwater and authorized non-stormwater before and after major grading activities;
- Stormwater and authorized non-stormwater discharge locations, including:
- Locations where stormwater and/or authorized non-stormwater will be discharged to storm drain inlets;[56] and
- Locations where stormwater or authorized non-stormwater will be discharged directly to waters of the U.S.
- Locations of all potential pollutant-generating activities identified in Part 7.2.3g;
- Locations of stormwater controls, including natural buffer areas and any shared controls utilized to comply with this permit; and
- Locations where polymers, flocculants, or other treatment chemicals will be used and stored.

## SECTION 3: DOCUMENTATION OF COMPLIANCE WITH OTHER FEDERAL REQUIREMENTS

### *3.1 Endangered Species Protection*

**Instructions (see CGP 7.2.9, Appendix D, and the "Endangered Species Protection" section of the Appendix J – NOI form):**

Follow the process in Appendix D of the permit for determining which eligibility criterion (A-E) you have met with respect to the protection of endangered species. You will

- Include documentation supporting your determination of eligibility.
- Additional information on Endangered Species Act (ESA) provisions for EPA's Construction General Permit is at www.epa.gov/npdes/stormwater/esa

#### 3.1.1. Eligibility Criterion

Under which criterion listed in Appendix D are you eligible for coverage under this permit?

☐ **A** ☐ **B** ☐ **C** ☐ **D** ☐ **E**

Delete the following reference material from the final SWPPP document

For reference purposes, the eligibility criteria listed in Appendix D are as follows:

**Criterion A.** No federally-listed threatened or endangered species or their designated critical habitat(s) are likely to occur in your site's "action area" as defined in Appendix A of this permit.

**Criterion B.** The construction site's discharges and discharge-related activities were already addressed in another operator's valid certification of eligibility for your action area under eligibility Criterion A, C, D, E, or F and there is no reason to believe that federally-listed species or federally-designated critical habitat not considered in the prior certification may be present or located in the "action area". To certify your eligibility under this Criterion, there must be no lapse of NPDES permit coverage in the other operator's certification. By certifying eligibility under this Criterion, you agree to comply with any effluent limitations or conditions upon which the other operator's certification was based. You must include in your NOI the tracking number from the other operator's notification of authorization under this permit. If your certification is based on another operator's certification under Criterion C, you must provide EPA with the relevant supporting information required of existing dischargers in Criterion C in your NOI form.

**Criterion C.** Federally-listed threatened or endangered species or their designated critical habitat(s) are likely to occur in or near your site's "action area," and your site's discharges and discharge-related activities are not likely to adversely affect listed threatened or endangered species or critical habitat. This determination may include consideration of any stormwater controls and/or management practices you will adopt to ensure that your discharges and discharge-related activities are not likely to adversely affect listed species and critical habitat. To make this certification, you must include the following in your NOI: 1) any federally listed species and/or designated habitat located in your "action area"; and 2) the distance between your site and the listed species or designated critical habitat (in miles). You must also include a copy of your site map with your NOI.

**Criterion D.** Coordination between you and the Services has been concluded. The coordination must have addressed the effects of your site's discharges and discharge-related activities on federally-listed threatened or endangered species and federally-designated critical habitat, and must have resulted in a written concurrence from the relevant Service(s) that your site's discharges and discharge-related activities are not likely to adversely affect listed species or critical habitat. You must include copies of the correspondence between yourself and the Services in your SWPPP and your NOI.

**Criterion E.** Consultation between a Federal Agency and the U.S. Fish and Wildlife Service and/or the National Marine Fisheries Service under section 7 of the ESA has been concluded. The consultation must have addressed the effects of the construction site's discharges and discharge-related activities on federally-listed threatened or endangered species and federally-designated critical habitat. The result of this consultation must be either:

i. a biological opinion that concludes that the action in question (taking into account the effects of your site's discharges and discharge-related activities) is not likely to jeopardize the continued existence of listed species, nor the destruction or adverse modification of critical habitat; or

ii. written concurrence from the applicable Service(s) with a finding that the site's discharges and discharge-related activities are not likely to adversely affect federally-listed species or federally-designated habitat.

You must include copies of the correspondence between yourself and the Services in your SWPPP and your NOI.

**Criterion F.** Your construction activities are authorized through the issuance of a permit under section 10 of the ESA, and this authorization addresses the effects of the site's discharges and discharge-related activities on federally-listed species and federally-designated critical habitat. You must include copies of the correspondence between yourself and the Services in your SWPPP and your NOI.

### 3.1.2. Supporting Documentation.

Provide documentation for the applicable eligibility criterion you select in Appendix D of the 2017 CGP, as follows. Refer to Appendix K (NEPA Documentation) for ESA protection.

**For criterion A**, indicate the basis for your determination that no federally-listed threatened or endangered species or their designated critical habitat(s) are likely to occur in your site's action area (as defined in Appendix A of the permit). Check the applicable source of information you relied upon:

- ☐ Specific communication with staff of the U.S. Fish & Wildlife Service or National Marine Fisheries Service. INSERT DATE OF COMMUNICATION AND WHO YOU SPOKE WITH
- ☐ Publicly available species list. INSERT SPECIFIC DOCUMENT AND/OR WEBSITE RELIED UPON
- ☐ Other source: INSERT SPECIFIC SOURCE

**For criterion B**, provide the Tracking Number from the other operator's notification of permit authorization: INSERT AUTHORIZATION TRACKING NUMBER FROM OTHER OPERATOR'S NOTIFICATION LETTER/EMAIL

Provide a brief summary of the basis used by the other operator for selecting criterion A, B, C, D, E, or F: INSERT TEXT HERE

**For criterion C**, provide the following information:

- INSERT LIST OF FEDERALLY-LISTED SPECIES OR FEDERALLY-DESIGNATED CRITICAL HABITAT LOCATED IN YOUR ACTION AREA
- INSERT DISTANCE BETWEEN YOUR SITE AND THE LISTED SPECIES OR CRITICAL HABITAT (in miles)

Also, provide a brief summary of the basis used for determining that your site's discharges and discharge-related activities are not likely to adversely affect listed species or critical habitat: INSERT TEXT HERE

**For criterion D, E, or F**, attach copies of any letters or other communication between you and the U.S. Fish & Wildlife Service or National Marine Fisheries Service concluding consultation or coordination activities. INSERT COPIES OF LETTERS OR OTHER COMMUNICATIONS HERE

## *3.2 Historic Preservation*

**Instructions (see CGP Part 7.2.9.b, Appendix E, and the "Historic Preservation" section of the Appendix J – NOI form):**

Follow the screening process in Appendix E of the permit for determining whether your installation of subsurface earth-disturbing stormwater controls will have an effect on historic properties.

- Include documentation supporting your determination of eligibility.
- To contact your applicable state or tribal historic preservation office, information is available at *www.achp.gov/programs/html*.

### 3.2.1. Appendix E, Step 1

Do you plan on installing any of the following stormwater controls at your site? Check all that apply below, and proceed to Appendix E, Step 2.

- ☐ Dike
- ☐ Berm
- ☐ Catch Basin
- ☐ Pond
- ☐ Stormwater Conveyance Channel (e.g., ditch, trench, perimeter drain, swale, etc.)
- ☐ Culvert
- ☐ Other type of ground-disturbing stormwater control: INSERT SPECIFIC TYPE OF STORMWATER CONTROL

(Note: If you will not be installing any ground-disturbing stormwater controls, no further documentation is required for Section 3.2 of the Template.)

### 3.2.2. Appendix E, Step 2

If you answered yes in Step 1, have prior surveys or evaluations conducted on the site already determined that historic properties do not exist, or that prior disturbances at the site have precluded the existence of historic properties? ☐ YES ☐ NO

- If yes, no further documentation is required for Section 3.2 of the Template.
- If no, proceed to Appendix E, Step 3.

### 3.2.3. Appendix E, Step 3

If you answered no in Step 2, have you determined that your installation of subsurface earth-disturbing stormwater controls will have no effect on historic properties? ☐ YES ☐ NO

If yes, provide documentation of the basis for your determination. INSERT REFERENCES TO DOCUMENTS, STUDIES, OR OTHER SOURCES RELIED UPON

If no, proceed to Appendix E, Step 4.

### 3.2.4. Appendix E, Step 4

If you answered no in Step 3, did the State Historic Preservation Officer (SHPO), Tribal Historic Preservation Office (THPO), or other tribal representative (whichever applies) respond to you within 15 calendar days to indicate whether the subsurface earth disturbances caused by the installation of stormwater controls affect historic properties? ☐ YES ☐ NO

If no, no further documentation is required for Section 3.2 of the Template.

If yes, describe the nature of their response:

☐ Written indication that adverse effects to historic properties from the installation of stormwater controls can be mitigated by agreed upon actions. INSERT COPIES OF LETTERS, EMAILS, OR OTHER COMMUNICATION BETWEEN YOU AND THE APPLICABLE SHPO, THPO, OR OTHER TRIBAL REPRESENTATIVE

☐ No agreement has been reached regarding measures to mitigate effects to historic properties from the installation of stormwater controls. INSERT COPIES OF LETTERS, EMAILS, OR OTHER COMMUNICATION BETWEEN YOU AND THE APPLICABLE SHPO, THPO, OR OTHER TRIBAL REPRESENTATIVE

☐ Other: INSERT COPIES OF LETTERS, EMAILS, OR OTHER COMMUNICATION BETWEEN YOU AND THE APPLICABLE SHPO, THPO, OR OTHER TRIBAL REPRESENTATIVE

### *3.3 Safe Drinking Water Act Underground Injection Control Requirements*

**Instructions (see CGP Part 7.2.9.c):**

- If you will use any of the identified controls in this section, include documentation of contact between you and the applicable state agency or EPA Regional Office responsible for implementing the requirements for underground injection wells in the Safe Drinking Water Act and EPA's implementing regulations at 40 CFR Parts 144-147.
- For state UIC program contacts, refer to the following EPA website: *http://water.epa.gov/type/groundwater/uic/whereyoulive.cfm*.

The following controls will be installed as part of the project: Check all that apply below.

☐ Infiltration trenches (if stormwater is directed to any bored, drilled, driven shaft or dug hole that is deeper than its widest surface dimension, or has a subsurface fluid distribution system)

☐ Commercially manufactured pre-cast or pre-built proprietary subsurface detention vaults, chambers, or other devices designed to capture and infiltrate stormwater flow

☐ Drywells, seepage pits, or improved sinkholes (if stormwater is directed to any bored, drilled, driven shaft or dug hole that is deeper than its widest surface dimension, or has a subsurface fluid distribution system)

If yes, INSERT COPIES OF LETTERS, EMAILS, OR OTHER COMMUNICATION BETWEEN YOU AND THE STATE AGENCY OR EPA REGIONAL OFFICE

If no, This project does not employ underground injection controls and is in compliance with the Safe Drinking Water Act.

## SECTION 4: EROSION AND SEDIMENT CONTROLS

**General Instructions (See CGP Parts 2.2 and 7.2.6):**

- Describe the erosion and sediment controls that will be installed and maintained at your site.
- For more information or ideas on BMPs, see EPA's National Menu of BMPs http://www.epa.gov/npdes/stormwater/menuofbmps

### *4.1 Natural Buffers or Equivalent Sediment Controls*

**Instructions (see CGP Parts 2.2.1 and 7.2.6.b, and Appendix G):**

This section only applies to you if a surface water is located within 50 feet your construction activities. If this is the case, consult CGP Part 2.1.2.1 and Appendix G for information on how to comply with the buffer requirements.

- Describe the compliance alternative (CGP Part 2.1.2.1.a.i, ii, or iii) that was chosen to meet the buffer requirements, and include any required documentation supporting the alternative selected. The compliance alternative selected must be maintained throughout the duration of permit coverage. However, if you select a different compliance alternative during your period of permit coverage, you must modify your SWPPP to reflect this change.
- If you qualify for one of the exceptions in CGP Part 2.1.2.1.e, include documentation related to your qualification for such exceptions.

#### 4.1.1. Buffer Compliance Alternatives

Are there any surface waters within 50 feet of your project's earth disturbances? ☐ YES ☐ NO

(Note: If no, no further documentation is required for Part 4.1 in the SWPPP Template. Continue on to Part 4.2.)

Check the compliance alternative that you have chosen:

☐ I will provide and maintain a 50-foot undisturbed natural buffer.

(Note (1): You must show the 50-foot boundary line of the natural buffer on your site map.)

(Note (2): You must show on your site map how all discharges from your construction disturbances through the natural buffer area will first be treated by the site's erosion and sediment controls. Also, show on the site map any velocity dissipation devices used to prevent erosion within the natural buffer area.)

☐ I will provide and maintain an undisturbed natural buffer that is less than 50 feet and is supplemented by additional erosion and sediment controls, which in combination achieves the sediment load reduction equivalent to a 50-foot undisturbed natural buffer.

(Note (1): You must show the boundary line of the natural buffer on your site map.)

(Note (2): You must show on your site map how all discharges from your construction disturbances through the natural buffer area will first be treated by the site's erosion and

sediment controls. Also, show on the site map any velocity dissipation devices used to prevent erosion within the natural buffer area.)

- INSERT WIDTH OF NATURAL BUFFER TO BE RETAINED
- INSERT EITHER ONE OF THE FOLLOWING:

  (1) THE ESTIMATED SEDIMENT REMOVAL FROM A 50-FOOT BUFFER USING APPLICABLE TABLES IN APP. G, ATTACHMENT 1. INCLUDE INFORMATION ABOUT THE BUFFER VEGETATION AND SOIL TYPE THAT PREDOMINATE AT YOUR SITE

  OR

  (2) IF YOU CONDUCTED A SITE-SPECIFIC CALCULATION FOR THE ESTIMATED SEDIMENT REMOVAL OF A 50-FOOT BUFFER, PROVIDE THE SPECIFIC REMOVAL EFFICIENCY, AND INFORMATION YOU RELIED UPON TO MAKE YOUR SITE-SPECIFIC CALCULATION.
- INSERT DESCRIPTION OF ADDITIONAL EROSION AND SEDIMENT CONTROLS TO BE USED IN COMBINATION WITH NATURAL BUFFER AREA
- INSERT THE FOLLOWING INFORMATION:
  - (1) SPECIFY THE MODEL OR OTHER TOOL USED TO ESTIMATE SEDIMENT LOAD REDUCTIONS FROM THE COMBINATION OF THE BUFFER AREA AND ADDITIONAL EROSION AND SEDIMENT CONTROLS INSTALLED AT YOUR SITE, AND
  - (2) INCLUDE THE RESULTS OF CALCULATIONS SHOWING THAT THE COMBINATION OF YOUR BUFFER AREA AND THE ADDITIONAL EROSION AND SEDIMENT CONTROLS INSTALLED AT YOUR SITE WILL MEET OR EXCEED THE SEDIMENT REMOVAL EFFICIENCY OF A 50-FOOT BUFFER

☐ It is infeasible to provide and maintain an undisturbed natural buffer of any size, therefore I will implement erosion and sediment controls that achieve the sediment load reduction equivalent to a 50-foot undisturbed natural buffer.

- INSERT RATIONALE FOR CONCLUDING THAT IT IS INFEASIBLE TO PROVIDE AND MAINTAIN A NATURAL BUFFER OF ANY SIZE
- INSERT EITHER ONE OF THE FOLLOWING:

  (1) THE ESTIMATED SEDIMENT REMOVAL FROM A 50-FOOT BUFFER USING APPLICABLE TABLES IN APP. G, ATTACHMENT 1. INCLUDE INFORMATION ABOUT THE BUFFER VEGETATION AND SOIL TYPE THAT PREDOMINATE AT YOUR SITE

  OR

  (2) IF YOU CONDUCTED A SITE-SPECIFIC CALCULATION FOR THE ESTIMATED SEDIMENT REMOVAL OF A 50-FOOT BUFFER, PROVIDE THE SPECIFIC REMOVAL EFFICIENCY, AND INFORMATION YOU RELIED UPON TO MAKE YOUR SITE-SPECIFIC CALCULATION.
- INSERT DESCRIPTION OF ADDITIONAL EROSION AND SEDIMENT CONTROLS TO BE USED IN COMBINATION WITH NATURAL BUFFER AREA
- INSERT THE FOLLOWING INFORMATION:
  - (1) SPECIFY THE MODEL OR OTHER TOOL USED TO ESTIMATE SEDIMENT LOAD REDUCTIONS FROM THE EROSION AND SEDIMENT CONTROLS INSTALLED AT YOUR SITE, AND
  - (2) INCLUDE THE RESULTS OF CALCULATIONS SHOWING THAT THE ADDITIONAL EROSION AND SEDIMENT CONTROLS INSTALLED AT YOUR SITE WILL MEET OR EXCEED THE SEDIMENT REMOVAL EFFICIENCY OF A 50-FOOT BUFFER

☐ I qualify for one of the exceptions in Part 2.1.2.1.e. (If you have checked this box, provide information on the applicable buffer exception that applies, below.)

**4.1.2. Buffer Exceptions**

Which of the following exceptions to the buffer requirements applies to your site?

☐ There is no discharge of stormwater to the surface water that is located 50 feet from my construction disturbances.

(Note: If this exception applies, no further documentation is required for Section 4.1 of the Template.)

☐ No natural buffer exists due to preexisting development disturbances that occurred prior to the initiation of planning for this project.

(Note (1): If this exception applies, no further documentation is required for Section 4.1 of the Template.)

(Note (2): Where some natural buffer exists but portions of the area within 50 feet of the surface water are occupied by preexisting development disturbances, you must still comply with the one of the CGP Part 2.1.2.1.a compliance alternatives.)

☐ For a "linear project" (defined in Appendix A), site constraints (e.g., limited right-of-way) make it infeasible for me to meet any of the CGP Part 2.1.2.1.a compliance alternatives. INCLUDE DOCUMENTATION HERE OF THE FOLLOWING: (1) WHY IT IS INFEASIBLE FOR YOU TO MEET ONE OF THE BUFFER COMPLIANCE ALTERNATIVES, AND (2) BUFFER WIDTH RETAINED AND/OR SUPPLEMENTAL EROSION AND SEDIMENT CONTROLS TO TREAT DISCHARGES TO THE SURFACE WATER

☐ The project qualifies as "small residential lot" construction (defined in Part 2.1.2.1.e.iv and in Appendix A).

For Alternative 1 (see Appendix G, Part G.2.3.2.a):

- INSERT WIDTH OF NATURAL BUFFER TO BE RETAINED
- INSERT APPLICABLE REQUIREMENTS BASED ON TABLE G-1
- INSERT DESCRIPTION OF HOW YOU WILL COMPLY WITH THESE REQUIREMENTS

For Alternative 2 (see Appendix G, Part G.2.3.2.b):

- INSERT (1) THE ASSIGNED RISK LEVEL BASED ON APPLICABLE TABLE IN APP. G, PART G.2.3.2.b, AND (2) THE PREDOMINANT SOIL TYPE AND AVERAGE SLOPE AT YOUR SITE
- INSERT APPLICABLE REQUIREMENTS BASED ON APP. G, TABLE G-7
- INSERT DESCRIPTION OF HOW YOU WILL COMPLY WITH THESE REQUIREMENTS

☐ Buffer disturbances are authorized under a CWA Section 404 permit. INSERT DESCRIPTION OF ANY EARTH DISTURBANCES THAT WILL OCCUR WITHIN THE BUFFER AREA

(Note (1): If this exception applies, no further documentation is required for Section 4.1 of the Template.)

(Note (2): This exception only applies to the limits of disturbance authorized under the Section 404 permit, and does not apply to any upland portion of the construction project.)

☐ Buffer disturbances will occur for the construction of a water-dependent structure or water access area (e.g., pier, boat ramp, and trail). INSERT DESCRIPTION OF ANY EARTH DISTURBANCES THAT WILL OCCUR WITHIN THE BUFFER AREA

(Note (1): If this exception applies, no further documentation is required for Section 4.1 of the Template.)

## *4.2 Sediment Controls*

**Instructions (see CGP Parts 2.2.3 and 7.2.6):**

- Describe sediment controls that will be used (e.g., silt fences, filter berms, temporary diversion dikes, or fiber rolls) to meet the Part 2.2.3.a requirement to "install sediment controls along those perimeter areas of your site that will receive stormwater from earth-disturbing activities."
- For linear projects, where you have determined that the use of perimeter controls in portions of the site is impracticable, document why you believe this is to be the case.
- Also see, EPA's *Silt Fence BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/silt_fences or *Fiber Rolls BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/fiber_rolls

### 4.2.1 General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.3.a

### 4.2.2. Specific Perimeter Controls

*Perimeter Control # 1*

Perimeter Control Description

- INSERT DESCRIPTION OF PERIMETER CONTROL TO BE INSTALLED. INDICATE SPECIFIC CONTROLS THAT WILL BE INSTALLED AND MADE OPERATIONAL PRIOR TO EARTH DISTURBANCE
- INCLUDE COPIES OF DESIGN SPECIFICATIONS

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE PERIMETER CONTROL. AT A MINIMUM, CGP PART 2.2.3.a REQUIRES REMOVAL OF SEDIMENT "before it has accumulated to one-half of the above-ground height of any perimeter control."

[Repeat as needed for individual perimeter controls.]

### *4.3 Sediment Track-Out*

**Instructions (see CGP Parts 2.2.4 and 7.2.6):**

- Describe stormwater controls that will be used to "minimize the track-out of sediment onto off-site streets, other paved areas, and sidewalks from vehicles exiting your construction site."
- Describe location(s) of vehicle exit(s), procedures to remove accumulated sediment off-site (e.g., vehicle tracking), and stabilization practices (e.g., stone pads or wash racks or both) to minimize off-site vehicle tracking of sediment. Also include the design, installation, and maintenance specifications for each control.
- Also, see EPA's *Construction Entrances BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/cons_entrance

#### 4.3.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.4

#### 4.3.2. Specific Track-Out Controls

*Track-Out Control # 1*

Track-Out Control Description

- INSERT DESCRIPTION OF TRACK-OUT CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE TRACK-OUT CONTROL.

  (Note: At a minimum, you must provide for maintenance that meets the following requirement in CGP Part 2.2.4.d: "Where sediment has been tracked-out from your site onto the surface of off-site streets, other paved areas, and sidewalks, you must remove the deposited sediment by the end of the same work day in which the track-out occurs or by the end of the next work day if track-out occurs on a non-work day. You must remove the track-out by sweeping, shoveling, or vacuuming these surfaces, or by using other similarly effective means of sediment removal. You are prohibited from hosing or sweeping tracked-out sediment into any stormwater conveyance (unless it is connected to a sediment basin, sediment trap, or similarly effective control), storm drain inlet, or surface water.")

[Repeat as needed for individual track-out controls.]

### *4.4 Stockpiled Sediment or Soil*

**Instructions (see CGP Parts 2.2.5 and 7.2.6):**

- Describe stormwater controls and other measures you will take to minimize the discharge of sediment or soil particles from stockpiled sediment or soil. Include a description of structural practices (e.g., diversions, berms, ditches, storage basins), including design, installation, and maintenance specifications, used to divert flows from stockpiled sediment or soil, retain or detain flows, or otherwise limit exposure and the discharge of pollutants from stockpiled sediment or soil.
- Also, describe any controls or procedures used to minimize exposure resulting from adding to or removing materials from the pile.

#### 4.4.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.1.2.4

#### 4.4.2. Specific Stockpile Controls

*Stockpile Control # 1*
Stockpiled Sediment/Soil Control Description

- INSERT DESCRIPTION OF STOCKPILE CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE STOCKPILE CONTROL.
  (Note: At a minimum, you must comply with following requirement in CGP Part 2.2.5.d: Do not hose down or sweep soil or sediment accumulated on pavement or other impervious surfaces into any stormwater conveyance (unless connected to a sediment basin, sediment trap, or similarly effective control), storm drain inlet, or surface water.)

[Repeat as needed for individual stockpile controls.]

### *4.5 Minimize Dust*

**Instructions (see CGP Parts 2.2.5 and 7.2.6):**

Describe controls and procedures you will use at your project/site to minimize the generation of dust.

#### 4.5.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.5

#### 4.5.2. Specific Dust Controls

*Dust Control # 1*
Dust Control Description

- INSERT DESCRIPTION OF DUST CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE DUST CONTROL

[Repeat as needed for individual dust controls.]

### *4.6 Minimize the Disturbance of Steep Slopes*

**Instructions (see CGP Parts 2.2.7 and 7.2.6):**
- Describe how you will minimize the disturbance to steep slopes (as defined by CGP Appendix A).
- Describe controls (e.g., erosion control blankets, tackifiers), including design, installation and maintenance specifications, that will be implemented to minimize sediment discharges from slope disturbances.
- Also, see EPA's *Geotextiles BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/geotextiles

#### 4.6.1. General
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.7

#### 4.6.2. Specific Steep Slope Controls

*Steep Slope Control # 1*
Steep Slope Control Description
- INSERT DESCRIPTION OF STEEP SLOPE CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE STEEP SLOPE CONTROL

[Repeat as needed for individual steep slope controls.]

## *4.7 Topsoil*

**Instructions (see CGP Parts 2.2.8 and 7.2.6):**

- Describe how topsoil will be preserved and identify these areas and associated control measures on your site map(s).
- If it is infeasible for you to preserve topsoil on your site, provide an explanation for why this is the case.

### 4.7.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.8. IF IT IS INFEASIBLE FOR YOU TO COMPLY WITH THE REQUIREMENT, INCLUDE AN EXPLANATION OF WHY THIS IS THE CASE.

### 4.7.2. Specific Topsoil Controls

*Topsoil Control # 1*
Topsoil Control Description

- INSERT DESCRIPTION OF TOPSOIL CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE TOPSOIL CONTROL

[Repeat as needed for individual topsoil controls.]

## *4.8 Soil Compaction*

**Instructions (see CGP Parts 2.2.9 and 7.2.10):**

- In areas where final vegetative stabilization will occur or where infiltration practices will be installed, describe the controls, including design, installation, and maintenance specifications that will be used to restrict vehicle or equipment access or condition the soil for seeding or planting.

### 4.8.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.9

### 4.8.2. Specific Soil Compaction Controls

*Soil Compaction Control # 1*
Soil Compaction Control Description

- INSERT DESCRIPTION OF SOIL COMPACTION CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE SOIL COMPACTION CONTROL

[Repeat as needed for individual soil compaction controls.]

### *4.9 Storm Drain Inlets*

**Instructions (see CGP Parts 2.2.10 and 7.2.6):**
- Describe controls (e.g., inserts, rock-filled bags, or block and gravel) including design, installation, and maintenance specifications that will be implemented to protect all inlets that will receive stormwater from your construction activities, and that you have authority to access.
- Also, see EPA's *Storm Drain Inlet Protection BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/storm_drain

**General**
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.10

**Specific Storm Drain Inlet Controls**

*Storm Drain Inlet Control # 1*
Storm Drain Inlet Control Description
- INSERT DESCRIPTION OF STORM DRAIN INLET CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE STORM DRAIN INLET CONTROL
  (Note: At a minimum, you must comply with following requirement in CGP Part 2.2.10.b: "Clean, or remove and replace, the protection measures as sediment accumulates, the filter becomes clogged, and/or performance is compromised. Where there is evidence of sediment accumulation adjacent to the inlet protection measure, you must remove the deposited sediment by the end of the same work day in which it is found or by the end of the following work day if removal by the same work day is not feasible.")

[Repeat as needed for individual storm drain inlet controls.]

### *4.10 Constructed Stormwater Conveyance Channels*

**Instructions (see CGP Parts 2.2.11 and 7.2.6):**

If you will be installing a stormwater conveyance channel, describe control practices (e.g., velocity dissipation devices), including design specifications and details (volume, dimensions, outlet structure), that will be implemented at the construction site.

#### 4.10.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.11

#### 4.10.2. Specific Conveyance Channel Controls

*Stormwater Conveyance Channel Control # 1*
Stormwater Conveyance Channel Control Description

- INSERT DESCRIPTION OF STORMWATER CONVEYANCE CHANNEL CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE STORMWATER CONVEYANCE CHANNEL CONTROL

[Repeat as needed for individual stormwater conveyance channel controls.]

### *4.11 Sediment Basins*

**Instructions (see CGP Parts 2.2.12 and 7.2.6):**

If you will install a sediment basin, include design specifications and other details (volume, dimensions, outlet structure) that will be implemented at in conformance with CGP Part 2.2.12.

- At a minimum, sediment ponds must provide storage for either (1) the calculated volume of runoff from the 2-year, 24-hour storm (see CGP App. H), or (2) 3,600 cubic feet per acre drained
- Sediment ponds must also utilize outlet structures that withdraw water from the surface, , unless infeasible
- Also, see EPA's *Sediment Basin BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/sediment_basins

#### 4.11.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.2.12. IF YOU HAVE DETERMINED THAT IT IS INFEASIBLE FOR YOU TO UTILIZE AN OUTLET STRUCTURE THAT DISCHARGES FROM THE SURFACE, PROVIDE AN EXPLANATION FOR WHY THIS IS THE CASE.

### 4.11.2. Specific Sediment Basin Controls

*Sediment Basin Control # 1*
Sediment Basin Control Description
- INSERT DESCRIPTION OF SEDIMENT BASIN CONTROL TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE SEDIMENT BASIN CONTROL
  (Note: At a minimum, you must comply with following requirement in CGP Part 2.1.3.2.b: "Keep in effective operating condition and remove accumulated sediment to maintain at least ½ of the design capacity of the sediment basin at all times.")

[Repeat as needed for individual sediment basin controls.]

## *4.12 Chemical Treatment*

**Instructions (see CGP Parts 2.2.13 and 7.2.6.b.v):**
If you are using treatment chemicals at your site, provide details for each of the items below. This information is required as part of the SWPPP requirements in CGP Part 7.2.6.b.v.

### 4.12.1. Soil Types
List all the soil types (including soil types expected to be found in fill material) that are expected to be exposed during construction and that will be discharged to locations where chemicals will be applied: INSERT TEXT HERE

### 4.12.2. Treatment Chemicals
List all treatment chemicals that will be used at the site and explain why these chemicals are suited to the soil characteristics: INSERT TEXT HERE

Describe the dosage of all treatment chemicals you will use at the site or the methodology you will use to determine dosage: INSERT TEXT HERE

Provide information from any applicable Material Safety Data Sheets (MSDS): INSERT TEXT HERE

Describe how each of the chemicals will stored: INSERT TEXT HERE

Include references to applicable state or local requirements affecting the use of treatment chemicals, and copies of applicable manufacturer's specifications regarding the use of your specific treatment chemicals and/or chemical treatment systems: INSERT TEXT HERE

### 4.12.3. Special Controls for Cationic Treatment Chemicals (if applicable)
If you have been authorized by your applicable Regional Office to use cationic treatment chemicals, include the official EPA authorization letter or other communication, and identify the specific controls and implementation procedures you are required to implement to ensure that your use of cationic treatment chemicals will not lead to a violation of water quality standards: INSERT (1) ANY LETTERS OR OTHER

DOCUMENTS SENT FROM THE EPA REGIONAL OFFICE CONCERNING YOUR USE OF CATIONIC TREATMENT CHEMICALS, AND (2) DESCRIPTION OF ANY SPECIFIC CONTROLS YOU ARE REQUIRED TO IMPLEMENT

**4.12.4. Schematic Drawings of Stormwater Controls/Chemical Treatment Systems**
Provide schematic drawings of any chemically-enhanced stormwater controls or chemical treatment systems to be used for application of treatment chemicals: INSERT TEXT HERE

**4.12.5. Training**
Describe the training that personnel who handle and apply chemicals have received prior to permit coverage, or will receive prior to the use of treatment chemicals: INSERT TEXT HERE

### *4.13 Dewatering Practices*

**Instructions (see CGP Parts 2.4):**

If you will be discharging stormwater that is removed from excavations, trenches, foundations, vaults, or other similar points of accumulation, include design specifications and details of all dewatering practices that are installed and maintained to comply with CGP Part 2.1.3.4.

**4.13.1. General.**
Dewatering will be conducted in accordance with the Fort Carson Dewatering Policy (http://www.carson.army.mil/DPW/environmental/stormwater/documents/Dewatering-Guidance-for-Construction-Sites.pdf) Refer to Appendix O for a copy of the policy.

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.4

**4.13.2. Specific Dewatering Practices**

*Dewatering Practice # 1*
Dewatering Practice Description

- INSERT DESCRIPTION OF DEWATERING PRACTICE TO BE INSTALLED
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE DEWATERING PRACTICE
  (Note: At a minimum, you must comply with following requirement in CGP Part 2.1.3.4: "With backwash water, either haul it away for disposal or return it to the beginning of the treatment process; and replace and clean the filter media used in dewatering devices when the pressure differential equals or exceeds the manufacturer's specifications.")

[Repeat as needed for individual dewatering practices.]

### *4.14 Other Stormwater Controls*

**Instructions:**

- Describe any other stormwater controls that do not fit into the above categories.

#### 4.14.1. General

- INSERT GENERAL DESCRIPTION OF THE PROBLEM THIS CONTROL IS DESIGNED TO ADDRESS

#### 4.14.2. Specific Stormwater Control Practices

*Stormwater Control Practice # 1*

Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE STORMWATER CONTROL PRACTICE

[Repeat as needed.]

### *4.15 Site Stabilization*

**Instructions (see CGP Parts 2.2.14 and 7.2.6.b.vi):**

The CGP requires you to immediately initiate stabilization when work in an area of your site has permanently or temporarily stopped, and to complete certain stabilization activities within prescribed deadlines. See CGP Part 2.2.14. The CGP also requires that stabilization measures meet certain minimum criteria. See CGP Part 2.2.14. For your SWPPP, you must include the following:

- Describe the specific vegetative and/or non-vegetative practices that will be used to stabilize exposed soils where construction activities have temporarily or permanently ceased. Avoid using impervious surfaces for stabilization whenever possible.
- Each practice can either must be either vegetative or non-vegetative and temporary or permanent. If a specific stabilization practice wtill be both temporary and permanent, two enteries are required.
- Also, see EPA's *Seeding BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/seeding

**4.15.1. Site Stabilization Practice #1**
☐ *Vegetative* ☐ *Non-Vegetative*
☐ *Temporary* ☐ *Permanent*

Description of Practice
- INSERT DESCRIPTION OF STABILIZATION PRACTICE TO BE INSTALLED
- NOTE HOW DESIGN WILL MEET REQUIREMENTS OF PART 2.2.14, WHICHEVER APPLIES
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE, OR REFER TO DRAWINGS AND DESIGN SPECIFICATIONS IN AN APPENDIX

Installation
- FOR VEGETATIVE STABILIZATION IN ARID OR SEMI-ARID AREAS, INDICATE THE BEGINNING AND ENDING DATES OF THE SEASONALLY DRY PERIOD AND DESCRIBE YOUR SITE CONDITIONS
- INSERT APPROXIMATE DATE OF INSTALLATION
- INSERT APPROXIMATE COMPLETION DATE CONSISTENT WITH CGP PART 2.2.14

Maintenance Requirements
INSERT MAINTENANCE REQUIREMENTS FOR THE STABILIZATION PRACTICE

**4.15.2. Site Stabilization Practice #2**
☐ *Vegetative* ☐ *Non-Vegetative*
☐ *Temporary* ☐ *Permanent*

Description of Practice
- INSERT DESCRIPTION OF STABILIZATION PRACTICE TO BE INSTALLED
- NOTE HOW DESIGN WILL MEET REQUIREMENTS OF PART 2.2.14, WHICHEVER APPLIES
- INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE, OR REFER TO DRAWINGS AND DESIGN SPECIFICATIONS IN AN APPENDIX

Installation
- FOR VEGETATIVE STABILIZATION IN ARID OR SEMI-ARID AREAS, INDICATE THE BEGINNING AND ENDING DATES OF THE SEASONALLY DRY PERIOD AND DESCRIBE YOUR SITE CONDITIONS
- INSERT APPROXIMATE DATE OF INSTALLATION
- INSERT APPROXIMATE COMPLETION DATE CONSISTENT WITH CGP PART 2.2.14

Maintenance Requirements
INSERT MAINTENANCE REQUIREMENTS FOR THE STABILIZATION PRACTICE

[Repeat as needed for additional stabilization practices.]

**4.16. Final Stabilization.** The Fort Carson Stormwater Program is required to conduct a final inspection. 70% site stabilization is required before an NOT will be issued.

**4.17. Stabilization Documentation.** Describe how temporary and final stabilization measures will be documented in the SWPPP. Refer to Appendix H (Grading and Stabilization Log)

## SECTION 5: POLLUTION PREVENTION STANDARDS

### *5.1 Potential Sources of Pollution*

**Instructions (see CGP Part 2.3 and 7.2.6):**

- Identify and describe all pollutant-generating activities at your site (e.g., paving operations; concrete, paint, and stucco washout and waste disposal; solid waste storage and disposal).
- For each pollutant-generating activity, include an inventory of pollutants or pollutant constituents associated with that activity (e.g., sediment, fertilizers, and/or pesticides, paints, solvents, fuels), which could be exposed to rainfall or snowmelt, and could be discharged from your construction site. You must take into account where potential spills and leaks could occur that contribute pollutants to stormwater discharges.

INSERT TEXT OR USE TABLE BELOW

| **Pollutant-Generating Activity** | **Pollutants or Pollutant Constituents** (that could be discharged if exposed to stormwater) | **Location on Site** (or reference SWPPP site map where this is shown) |
|---|---|---|
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |
| | | |

[Include additional rows as necessary.]

### *5.2 Spill Prevention and Response*

**Instructions (see CGP Parts 2.3 and 7.2.6.):**

- Describe procedures you will use to prevent and respond to leaks, spills, and other releases. You must implement the following at a minimum:
  - ✓ Procedures for expeditiously stopping, containing, and cleaning up spills, leaks, and other releases. Identify the name or title of the employee(s) responsible for detection and response of spills or leaks; and
  - ✓ Procedures for notification of appropriate facility personnel, emergency response agencies, and regulatory agencies where a leak, spill, or other release containing a hazardous substance or oil in an amount equal to or in excess of a reportable quantity consistent with Part 2.3.3.4c and established under either 40 CFR Part 110, 40 CFR Part 117, or 40 CFR Part 302, occurs during a 24-hour period. Contact information must be in locations that are readily accessible and available.
- Some projects/site may be required to develop a Spill Prevention Control and Countermeasure (SPCC) plan under a separate regulatory program (40 CFR 112). If you are required to develop an SPCC plan, or you already have one, you should include references to the relevant requirements from your plan.

INSERT SPILL PREVENTION AND RESPONSE PROCEDURES HERE

Include the Fort Carson Spill Response Guidance and Fort Carson Spill Poster as Appendix P. They are available at: http://www.carson.army.mil/DPW/environmental/stormwater/index2.html

### *5.3 Fueling and Maintenance of Equipment or Vehicles*

**Instructions (see CGP Parts 2.3.1):**

- Describe equipment/vehicle fueling and maintenance practices that will be implemented to eliminate the discharge of spilled or leaked chemicals (e.g., providing secondary containment *(examples: spill berms, decks, spill containment pallets)* and cover where appropriate, and/or having spill kits readily available.
- Also, see EPA's *Vehicle Maintenance and Washing Areas BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/vehicile_maintain

#### 5.3.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH THE CGP PART 2.3.1 REQUIREMENT TO "provide an effective means of eliminating the discharge of spilled or leaked chemicals, including fuel, from the area where these activities will take place"

#### 5.3.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.4 Washing of Equipment and Vehicles*

**Instructions (see CGP Parts 2.3.2):**

- Describe equipment/vehicle washing practices that will be used to minimize the discharge of pollutants from equipment and vehicle washing, wheel wash water, and other types of washing (e.g., locating activities away from surface waters and stormwater inlets or conveyances and directing wash waters to a sediment basin or sediment trap, using filtration devices, such as filter bags or sand filters, or using other similarly effective controls).
- Describe how you will prevent the discharge of soaps, detergents, or solvents by providing either (1) cover (*examples: plastic sheeting or temporary roofs*) to prevent these detergents from coming into contact with rainwater, or (2) a similarly effective means designed to prevent the discharge of pollutants from these areas.
- Also, see EPA's *Vehicle Maintenance and Washing Areas BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/vehicile_maintain

#### 5.4.1. General
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.2

#### 5.4.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.5 Storage, Handling, and Disposal of Construction Products, Materials, and Wastes*

**Instructions (see CGP Parts 2.3.3):**

- For any of the types of construction products, materials, and wastes below in Sections 5.5.1-5.5.6 below that are expected to be used or stored at your site, provide the information on how you will comply with the corresponding CGP provision and the specific practices that will be employed.
- Also, see EPA's *General Construction Site Waste Management BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/cons_wasteman

#### *5.5.1 Building Products*

(Note: Examples include asphalt sealants, copper flashing, roofing materials, adhesives, concrete admixtures.)

**5.5.1.1. General**

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.a.

**5.5.1.2. Specific Pollution Prevention Practices**

*Pollution Prevention Practice # 1*

Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

#### *5.5.2 Pesticides, Herbicides, Insecticides, Fertilizers, and Landscape Materials*

**5.5.2.1. General**

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.b

**5.5.2.2. Specific Pollution Prevention Practices**

*Pollution Prevention Practice # 1*

Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.5.3 Diesel Fuel, Oil, Hydraulic Fluids, Other Petroleum Products, and Other Chemicals*

#### 5.5.3.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.c

#### 5.5.3.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.5.4 Hazardous or Toxic Waste*

(Note: Examples include paints, solvents, petroleum-based products, wood preservatives, additives, curing compounds, acids.)

#### 5.5.4.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.d

#### 5.5.4.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description

- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation

- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements

- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.5.5 Construction and Domestic Waste*

(Note: Examples include packaging materials, scrap construction materials, masonry products, timber, pipe and electrical cuttings, plastics, styrofoam, concrete, and other trash or building materials.)

#### 5.5.5.1. General

- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.e

#### 5.5.5.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

### *5.5.6 Sanitary Waste*

#### 5.5.6.1. General
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.3.f

#### 5.5.6.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

## *5.6 Washing of Applicators and Containers used for Paint, Concrete or Other Materials*

**Instructions (see CGP Parts 2.3.4):**

- Describe how you will comply with the CGP Part 2.3.4 requirement to "provide an effective means of eliminating the discharge of water from the washout and cleanout of stucco, paint, concrete, form release oils, curing compounds, and other construction materials."
- Also, see EPA's *Concrete Washout BMP Fact Sheet* at www.epa.gov/npdes/stormwater/menuofbmps/construction/concrete_wash

#### 5.6.1. General
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.4

### 5.6.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

## *5.7 Fertilizers*

**Instructions (CGP Parts 2.3.5):**

Describe how you will comply with the CGP Part 2.3.5 requirement to "minimize discharges of fertilizers containing nitrogen or phosphorus"

### 5.7.1. General
- INSERT GENERAL DESCRIPTION OF HOW YOU WILL COMPLY WITH CGP PART 2.3.5

### 5.7.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed for individual fertilizer practices.]

## *5.8 Other Pollution Prevention Practices*

**Instructions:**

Describe any additional pollution prevention practices that do not fit into the above categories.

### 5.8.1. General
- INSERT GENERAL DESCRIPTION OF THE PROBLEM THIS CONTROL IS DESIGNED TO ADDRESS

### 5.8.2. Specific Pollution Prevention Practices

*Pollution Prevention Practice # 1*
Description
- INSERT DESCRIPTION OF PRACTICE TO BE INSTALLED
- IF APPLICABLE INCLUDE COPIES OF DESIGN SPECIFICATIONS HERE

Installation
- INSERT APPROXIMATE DATE OF INSTALLATION

Maintenance Requirements
- INSERT MAINTENANCE REQUIREMENTS FOR THE POLLUTION PREVENTION PRACTICE

[Repeat as needed.]

## SECTION 6: INSPECTION, CORRECTIVE ACTION, AND SWPPP MODIFICATION

### *6.1 Inspection Personnel and Procedures*

**Instructions (see CGP Part 4):**

Describe the procedures you will follow for conducting inspections in accordance with CGP Parts 4.

#### 6.1.1. Personnel Responsible for Inspections

INSERT NAMES OF PERSONNEL OR TYPES OF PERSONNEL WHO WILL BE CONDUCTING SITE INSPECTIONS HERE

Note: All personnel conducting inspections must be considered a "qualified person." CGP Part 4.1 clarifies that a "qualified person" is a person knowledgeable in the principles and practices of erosion and sediment controls and pollution prevention, who possesses the skills to assess conditions at the construction site that could impact stormwater quality, and the skills to assess the effectiveness of any stormwater controls selected and installed to meet the requirements of this permit.

The Ft. Carson Stormwater Program will conducts quarterly inspections to check compliance with the CGP. The program manager will contact the project proponent to schedule site visits, check the SWPPP updates, and check that routine inspections are performed.

#### 6.1.2. Inspection Schedule

Specific Inspection Frequency – Fort Carson discharge to Fountain Creek, which is impaired for E. Coli. To comply with Part 4.3, a 7 day inspection schedule is required for projects at Fort Carson.

INSERT INSPECTION SCHEDULE BASED PART 4.3 AND 7.2.7

Rain Gauge Location (if applicable)

SPECIFY LOCATION(S) OF RAIN GAUGE TO BE USED FOR DETERMINING WHETHER A RAIN EVENT OF 0.25 INCHES OR GREATER HAS OCCURRED (only applies to inspections conducted for Part 4.2, 4.3, or 4.4)

Note: Weather information for Fort Carson is available through the US Geological Survey Weather station at https://nwis.waterdata.usgs.gov/co/nwis/current/?type=precip&group_key=county_cd under the Sullivan Park and Fort Carson Rod and Gun Club weather stations.

Reductions in Inspection Frequency (if applicable)

- For the reduction in inspections resulting from stabilization: SPECIFY (1) LOCATIONS WHERE STABILIZATION STEPS HAVE BEEN COMPLETED AND (2) DATE THAT THEY WERE COMPLETED
  (Note: It is likely that you will not be able to include this in your initial SWPPP. If you qualify for this reduction (see CGP Part 4.4.1 and Part 7.2.7.c/d), you will need to modify your SWPPP to include this information.)

- For the reduction in inspections in arid, semi-arid, or drought-stricken areas: INSERT BEGINNING AND ENDING DATES OF THE SEASONALLY-DEFINED ARID PERIOD FOR YOUR AREA OR THE VALID PERIOD OF DROUGHT

- For reduction in inspections due to frozen conditions: INSERT BEGINNING AND ENDING DATES OF FROZEN CONDITIONS ON YOUR SITE

**6.1.3. Areas that Must Be Inspected.** During site inspections, the following areas will be inspected:

- All areas that have been cleared, graded, or excavated and that have not yet completed stabilization consistent with Part 2.2.14a;
- All stormwater controls (including pollution prevention controls) installed at the site to comply with this permit;[50]
- Material, waste, borrow, and equipment storage and maintenance areas that are covered by this permit;
- All areas where stormwater typically flows within the site, including drainageways designed to divert, convey, and/or treat stormwater;
- All points of discharge from the site; and
- All locations where stabilization measures have been implemented.

**6.1.4. Requirements for Inspections.** During inspections, inspectors will:

- Check whether all stormwater controls *(i.e., erosion and sediment controls and pollution prevention controls)* are properly installed, appear to be operational, and are working as intended to minimize pollutant discharges;
- Check for the presence of conditions that could lead to spills, leaks, or other accumulations of pollutants on the site;
- Identify any locations where new or modified stormwater controls are necessary to meet the requirements of Parts 2 and/or 3;
- Check for signs of visible erosion and sedimentation *(i.e., sediment deposits)* that have occurred and are attributable to your discharge at points of discharge and, if applicable, the banks of any waters of the U.S. flowing within or immediately adjacent to the site;
- Identify any incidents of noncompliance observed;
- If a discharge is occurring during your inspection:
    - Identify all discharge points at the site; and
    - Observe and document the visual quality of the discharge, and take note of the characteristics of the stormwater discharge, including color; odor; floating, settled, or suspended solids; foam; oil sheen; and other indicators of stormwater pollutants.
- Based on the results of the inspection, complete any necessary maintenance under CGP Part 2.1.4 and corrective action under CGP Part 5.

**6.1.5. Inspection Report Forms**

Refer to Appendix D for the Inspection Form.

## 6.2 *Corrective Action*

**Instructions (CGP Parts 5 and 7.2.7):**

– Describe the procedures for taking corrective action in compliance with CGP Part 5.

**6.2.1 Conditions Triggering Corrective Action.**

- A stormwater control needs repair or replacement (beyond routine maintenance required under Part 2.1.4); or
- A stormwater control necessary to comply with the requirements of this permit was never installed, or was installed incorrectly; or
- Discharges are causing an exceedance of applicable water quality standards; or
- A prohibited discharge has occurred (see Part 1.3).

**6.2.3 Corrective Action Deadlines.**

For any corrective action triggering conditions in Part 5.:

- Immediately take all reasonable steps to address the condition, including cleaning up any contaminated surfaces so the material will not discharge in subsequent storm events;
- When the problem does not require a new or replacement control or significant repair, the corrective action must be completed by the close of the next business day;
- When the problem requires a new or replacement control or significant repair, install the new or modified control and make it operational, or complete the repair, by no later than seven (7) calendar days from the time of discovery.
- If it is infeasible to complete the installation or repair within seven (7) calendar days, document in the SWPPP records why it is infeasible to complete the installation or repair within the 7-day timeframe and document the schedule for installing the stormwater control(s) and making it operational as soon as feasible after the 7-day timeframe.
- Where these actions result in changes to any of the stormwater controls or procedures documented in your SWPPP, modify the SWPPP accordingly within seven (7) calendar days of completing this work.

**6.2.3. Documentation of Corrective Actions.**

Address how corrective actions will be documented. Documentation of corrected actions must be completed within 24 hours. Refer to Appendix E for the Corrective Action Log.

**6.2.4. Corrective Action Forms.**

Refer to Appendix E for the Corrective Action Form.

**6.3. Modifications to the SWPPP.**

Address the process for modifying the SWPPP and how modifications will be documented. Refer to Appendix F.

**6.3. Records Maintenances.**

State the requirement to retain all records for 3 years after completion of project. (Part CGP 4.7.4, 5.4.5)

## SECTION 7: TRAINING

**Instructions (see CGP Part 6 and 7.2.8):**

- Complete the table below to provide documentation that the personnel required to be trained in CGP Part 6 completed the appropriate training
- If personnel will be taking course training (which is not required as part of the CGP), consider using Appendix I to track completion of this training
- The following personnel, at a minimum, must be receive training, and therefore should be listed out individually in the table below:
  - ✓ Personnel who are responsible for the design, installation, maintenance, and/or repair of stormwater controls (including pollution prevention measures);
  - ✓ Personnel responsible for the application and storage of treatment chemicals (if applicable);
  - ✓ Personnel who are responsible for conducting inspections as required in Part 4.1.1; and
  - ✓ Personnel who are responsible for taking corrective actions as required in Part 5.
- CGP Part 6 requires that the required personnel must be trained to understand the following if related to the scope of their job duties:
  - ✓ The location of all stormwater controls on the site required by this permit, and how they are to be maintained;
  - ✓ The proper procedures to follow with respect to the permit's pollution prevention requirements; and
  - ✓ When and how to conduct inspections, record applicable findings, and take corrective actions.

**Table 7-1: Documentation for Completion of Training**

| Name | Date Training Completed |
|---|---|
| INSERT NAME OF PERSONNEL HERE | INSERT COMPLETION DATE HERE |
| INSERT NAME OF PERSONNEL HERE | INSERT COMPLETION DATE HERE |
| INSERT NAME OF PERSONNEL HERE | INSERT COMPLETION DATE HERE |
| INSERT NAME OF PERSONNEL HERE | INSERT COMPLETION DATE HERE |

| INSERT NAME OF PERSONNEL HERE | INSERT COMPLETION DATE HERE |

Refer to training certificates in Appendix L.

## SECTION 8: CERTIFICATION AND NOTIFICATION

**Instructions (CGP Part 7.2.10 and Appendix I, Part I.11.2):**

- The following certification statement must be signed and dated by a person who meets the requirements of Appendix I, Part I.11.b.
- This certification must be re-signed in the event of a SWPPP Modification.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Name: _____ Title: _____

Signature: _____ Date: _____

[Repeat as needed for multiple construction operators at the site.]

**SWPPP APPENDICES**

Attach the following documentation to the SWPPP:

***Appendix A – Site Maps***

***Appendix B – Copy of 2017 CGP***

***Appendix C – NOI and EPA Authorization Email***

***Appendix D – Inspection Form***

**Appendix A – Site Maps**

INSERT SITE MAPS CONSISTENT WITH TEMPLATE SECTION 2.6

**Appendix B – Copy of 2017 CGP**

INSERT COPY OF 2017 CGP

https://www.epa.gov/npdes/epas-2017-construction-general-permit-cgp-and-related-documents

**Appendix C – Copy of NOI and EPA Authorization email**

INSERT COPY OF NOI AND EPA'S AUTHORIZATION EMAIL PROVIDING COVERAGE UNDER THE CGP

**Appendix D – Sample Copy of Inspection Form**

| General Information | | | |
|---|---|---|---|
| **Name of Project** | | | |
| **CGP Tracking No.** | | **Inspection Date** | |
| **Inspector Name, Title & Contact Information** | | | |
| **Present Phase of Construction** | | | |
| **Inspection Location** (if multiple inspections are required, specify location where this inspection is being conducted) | | | |

**Inspection Frequency** *(Note: you may be subject to different inspection frequencies in different areas of the site. Check all that apply. )*

**Standard Frequency**: ☐ Weekly ☐ Every 14 days and within 24 hours of a 0.25" rain

**Increased Frequency**: ☐ Every 7 days and within 24 hours of a 0.25" rain (for areas of sites discharging to sediment or nutrient-impaired waters or to waters designated as Tier 2, Tier 2.5, or Tier 3)

**Reduced Frequency**:

- ☐ Once per month (for stabilized areas)
- ☐ Once per month and within 24 hours of a 0.25" rain (for arid, semi-arid, or drought-stricken areas during seasonally dry periods or during drought)
- ☐ Once per month (for frozen conditions where earth-disturbing activities are being conducted)

**Was this inspection triggered by a 0.25" storm event?** ☐ Yes ☐ No

**If yes, how did you determined whether a 0.25" storm event has occurred?**

☐ Rain gauge on site ☐ Weather station representative of site. Specify weather station source:

**Total rainfall amount that triggered the inspection** (in inches)**:**

**Unsafe Conditions for Inspection**

**Did you determine that any portion of your site was unsafe for inspection per CGP Part 4.5.6?** ☐ Yes ☐ No

**If "yes", complete the following:**

- Describe the conditions that prevented you from conducting the inspection in this location:

- Location(s) where conditions were found:

| Condition and Effectiveness of Erosion and Sediment (E&S) Controls (CGP Part 2.2) | | | | |
|---|---|---|---|---|
| **Type/Location of E&S Control [Add an additional sheet if necessary]** | **Repairs or Other Maintenance Needed?*** | **Corrective Action Required?*** | **Date on Which Maintenance or Corrective Action First Identified?** | **Notes** |
| **1.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **2.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **3.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **4.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **5.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **6.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **7.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **8.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **9.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **10.** | ☐Yes ☐No | ☐Yes ☐No | | |

*** Note:** The permit differentiates between conditions requiring repairs and maintenance, and those requiring corrective action. The permit requires maintenance in order to keep controls in effective operating condition and requires repairs if controls are not operating as intended. Corrective actions are triggered only for specific, more serious conditions, which include: 1) A required stormwater control was never installed, was installed incorrectly, or not in accordance with the requirements in Part 2 and/or 3; 2) You become aware that the stormwater controls you have installed and are maintaining are not effective enough for the discharge to meet applicable water quality standards or applicable requirements in Part 3.1; 3) One of the prohibited discharges in Part 2.3.1 is occurring or has occurred; or 4) EPA requires corrective actions as a result of a permit violation found during an inspection carried out under Part 4.2. If a condition on your site requires a corrective action, you must also fill out a corrective action form found at www.epa.gov/npdes/stormwater/swppp. See Part 5 of the permit for more information.

| Condition and Effectiveness of Pollution Prevention (P2) Practices (CGP Part 2.3) | | | | |
|---|---|---|---|---|
| **Type/Location of P2 Practices [Add an additional sheet if necessary]** | **Repairs or Other Maintenance Needed?*** | **Corrective Action Required?*** | **Date on Which Maintenance or Corrective Action First Identified?** | **Notes** |
| **1.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **2.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **3.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **4.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **5.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **6.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **7.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **8.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **9.** | ☐Yes ☐No | ☐Yes ☐No | | |
| **10.** | ☐Yes ☐No | ☐Yes ☐No | | |

*** Note:** The permit differentiates between conditions requiring repairs and maintenance, and those requiring corrective action. The permit requires maintenance in order to keep controls in effective operating condition and requires repairs if controls are not operating as intended. Corrective actions are triggered only for specific, more serious conditions, which include: 1) A required stormwater control was never installed, was installed incorrectly, or not in accordance with the requirements in Part 2 and/or 3; 2) You become aware that the stormwater controls you have installed and are maintaining are not effective enough for the discharge to meet applicable water quality standards or applicable requirements in Part 3.1; 3) One of the prohibited discharges in Part 2.3.1 is occurring or has occurred; or 4) EPA requires corrective actions as a result of a permit violation found during an inspection carried out under Part 4.2. If a condition on your site requires a corrective action, you must also fill out a corrective action form found at www.epa.gov/npdes/stormwater/swppp. See Part 5 of the permit for more information.

| Stabilization of Exposed Soil (CGP Part 2.2.14) | | | |
|---|---|---|---|
| **Stabilization Area [Add an additional sheet if necessary]** | **Stabilization Method** | **Have You Initiated Stabilization?** | **Notes** |

# Sample Stormwater Corrective Action Plan

| **Section A – Initial Report (CGP Part 5.4.1)**<br>(Complete this section within 24 hours of discovering the condition that triggered corrective action) | | | | | |
|---|---|---|---|---|---|
| **Name of Project** | | **CGP Tracking No.** | | **Today's Date** | |
| **Date Problem First Discovered** | | **Time Problem First Discovered** | | | |
| **Name and Contact Information of Individual Completing this Form** | | | | | |

**What site conditions triggered the requirement to conduct corrective action** *(check the box that applies)*:

- ☐ A required stormwater control was never installed, was installed incorrectly, or not in accordance with the requirements in Part 2 and/or 3
- ☐ The stormwater controls that have been installed and maintained are not effective enough for the discharge to meet applicable water quality standards or applicable requirements in Part 3.1 of the permit
- ☐ A Part 2.3.1 prohibited discharge has occurred or is occurring
- ☐ EPA requires corrective action as a result of permit violations found during an EPA inspection carried out under Part 4.2

**Provide a description of the problem:**

**Deadline for completing corrective action** (*Enter date that is either: (1) no more than 7 calendar days after the date you discovered the problem, or (2) if it is infeasible to complete work within the first 7 days, enter the date that is as soon as practicable following the 7th day)*:

**Section B – Corrective Action Progress (CGP Part 5.4.2)**
(Complete this section no later than 7 calendar days after discovering the condition that triggered corrective action)

**Section B.1 – Why the Problem Occurred**

| **Cause(s) of Problem (Add an additional sheet if necessary)** | **How This Was Determined and the Date You Determined the Cause** |

| **1.** | | ☐Yes ☐No<br>If yes, provide date SWPPP modified: | |
| **2.** | | ☐Yes ☐No<br>If yes, provide date SWPPP modified: | |

## Section C – Certification and Signature (CGP Part 5.4.3)

### Section C.1 – Certification and Signature by Contractor or Subcontractor

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

**Signature of Contractor or Subcontractor:** _____ **Date:**

**Printed Name and Affiliation:** _____

### Section C.2 – Certification and Signature by Permittee

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

**Signature of Permittee or "Duly Authorized Representative":** _____ **Date:**

**Printed Name and Affiliation:** _____

**Appendix F – *Sample* SWPPP Amendment Log**

**Instructions (see CGP Part 7.4):**

- Create a log here of changes and updates to the SWPPP. You may use the table below to track these modifications.
- SWPPP modifications are required pursuant to CGP Part 7.4.1 in the following circumstances:
  - ✓ Whenever new operators become active in construction activities on your site, or you make changes to your construction plans, stormwater control measures, pollution prevention measures, or other activities at your site that are no longer accurately reflected in your SWPPP;
  - ✓ To reflect areas on your site map where operational control has been transferred (and the date of transfer) since initiating permit coverage;
  - ✓ If inspections or investigations determine that SWPPP modifications are necessary for compliance with this permit;
  - ✓ Where EPA determines it is necessary to impose additional requirements on your discharge; and
  - ✓ To reflect any revisions to applicable federal, state, tribal, or local requirements that affect the stormwater control measures implemented at the site.
- If applicable, if a change in chemical treatment systems or chemically-enhanced stormwater control is made, including use of a different treatment chemical, different dosage rate, or different area of application.

| No. | Description of the Amendment | Date of Amendment | Amendment Prepared by [Name(s) and Title] |
|---|---|---|---|

**Appendix G – *Sample* Subcontractor Certifications/Agreements**

SUBCONTRACTOR CERTIFICATION
STORMWATER POLLUTION PREVENTION PLAN

Project Number: _____

Project Title: _____

Operator(s): _____

As a subcontractor, you are required to comply with the Stormwater Pollution Prevention Plan (SWPPP) for any work that you perform on-site. Any person or group who violates any condition of the SWPPP may be subject to substantial penalties or loss of contract. You are encouraged to advise each of your employees working on this project of the requirements of the SWPPP. A copy of the SWPPP is available for your review at the office trailer.

Each subcontractor engaged in activities at the construction site that could impact stormwater must be identified and sign the following certification statement:

**I certify under the penalty of law that I have read and understand the terms and conditions of the SWPPP for the above designated project and agree to follow the practices described in the SWPPP.**

This certification is hereby signed in reference to the above named project:

Company: _____

Address: _____

Telephone Number: _____

Type of construction service to be provided: _____

_____

_____

Signature: _____

Title: _____

Date: _____

**Appendix H – *Sample* Grading and Stabilization Activities Log**

**Appendix J – *Sample* Delegation of Authority Form**

Delegation of Authority

I, _____ (name), hereby designate the person or specifically described position below to be a duly authorized representative for the purpose of overseeing compliance with environmental requirements, including the Construction General Permit, at the _____ construction site. The designee is authorized to sign any reports, stormwater pollution prevention plans and all other documents required by the permit.

_____ (name of person or position)
_____ (company)
_____ (address)
_____ (city, state, zip)
_____ (phone)

By signing this authorization, I confirm that I meet the requirements to make such a designation as set forth in Appendix I of EPA's Construction General Permit (CGP), and that the designee above meets the definition of a "duly authorized representative" as set forth in Appendix I.

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

1.2 GENERAL

The Contractor shall install and maintain stabilization and structural best management practices which will minimize erosion and sediment pollution from the construction site to the extent attainable. The Contractor shall be responsible for selection of appropriate best management practices as specified herein.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not haveing a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates

Mill Certificate or Affidavit

## 1.4 EROSION AND SEDIMENT CONTROLS

The controls and measures required by the Contractor are described below.

### 1.4.1 Stabilization Practices

The stabilization practices to be implemented may include temporary seeding, mulching, sod stabilization, vegetative buffer strips, erosion control blankets, protection of trees preservation of mature vegetation, etc. On his daily CQC Report, the Contractor shall record the dates when the major grading activities occur; when construction activities temporarily or permanently cease on a portion of the site; and when stabilization practices are initiated.

#### 1.4.1.1 Permanent Seeding

Disturbed areas of the site where construction activities permanently ceases shall be stabilized with permanent seeding no more than 14 days after the construction activity ceases, except as follows. When the initiation of permanent seeding is stopped due to snow cover or arid conditions, permanent seeding shall be initiated as soon as practicable.

#### 1.4.1.2 Temporary Seeding and Mulching

Areas where construction activities will temporarily cease for more than one year shall be temporarily seeded and mulched. Disturbed areas of the site where construction activities temporarily cease for more than 21 days and less than one year shall be stabilized with either temporary seeding and mulching or mulching not more than 14 days after construction activity ceases, except as follows. When the initiation of temporary stabilization measures is stopped due to snow cover or arid conditions, stabilization measures shall be initiated as soon as practicable.

#### 1.4.1.3 Erosion Control Blankets

Erosion control blanket may be installed on steep slopes and in drainage swales and ditches to protect finished grades from erosion.

### 1.4.2 Temporary Structural Practices

Temporary structural practices shall be implemented to divert flows from exposed soils, temporarily store flows, or otherwise limit runoff and the discharge of pollutants from exposed areas of the site to the degree attainable. Temporary structural practices shall be implemented in a timely manner during the construction process to minimize erosion and sediment runoff. Temporary structural practices shall include but not be limited to the following devices.

#### 1.4.2.1 Silt Fences

The Contractor shall provide silt fences as a temporary structural practice to minimize erosion and sediment runoff. Silt fences shall be properly installed to effectively retain sediment immediately after completing each phase of work where erosion would occur in the form of sheet and rill erosion (e.g. clearing and grubbing, excavation, embankment, and grading). Silt fence barriers shall be installed along the down slope boundary of all disturbed areas prior to begining land-distrubing activities in those areas. Silt fence barriers may be installed across ditches or swales but not where the drainage area is

greater than 1 acre. Removal of silt fence barriers shall be approved by the Contracting Officer.

1.4.2.2 Storm Drain Inlet Protection

Storm drain inlet protection shall be installed at each new and existing inlet which receives storm runoff from disturbed areas of 1 acre of less. The protection at each inlet shall be removed once the disturbed area has been finally stabilized.

1.4.2.3 Culvert Inlet Protection

Culvert inlet protection shall be installed at all culverts with a drainage area of 1 acre or less.

1.4.2.4 Rock Check Dams

Rock check dams may be used to reduce erosion of temporary or permanent ditches or swales. Type 1 rock check dams shall be used when the upstream drainage area is less than 2 acres. Type 2 rock check dams shall be used when the upstream area is 2 to 10 acres.

1.4.2.5 Stone Construction Entrance

A stone construction entrance shall be constructed wherever traffic will be leaving the construction site and move directly onto a paved road. Stone construction entrances shall be removed after the site has been finally stabilized.

1.4.2.6 Sediment Trap

Sediment traps may be constructed below disturbed areas where the total contributing drainage area is less than 3 acres. Sediment traps, when used, should be constructed prior to disturbance of upslope areas. Sediment traps must have an initial storage volume of 134 cubic yards per acre of drainage area, half of which shall be in the form of a permanent pool or wet storage to provide a stable settling medium. The remaining half shall be in the form of a drawdown or dry storage which will provide extended settling time during less frequent, larger storm events.

1.4.2.7 Diversion Dikes

Diversion dikes may be constructed to divert runoff from upslope drainage areas away from unprotected disturbed areas and slopes to a stabiilized outlet or to divert sediment-laden runoff from a disturbed area to a sediment-trapping facility such as a sediment trap or sediment basin. Diversion dikes shall have a maximum channel slope of 2 percent and shall be adequately compacted to prevent failure. The minimum height measured from the top of the dike to the bottom of the channel shall be 18 inches. The minimum base width shall be 6 feet and the minimum top width shall be 2 feet. The Contractor shall ensure that the diversion dikes are not damaged by construction operations or traffic.

PART 2 PRODUCTS

2.1 COMPONENTS FOR SILT FENCES

2.1.1 Geotextile

The geotextile shall comply with the requirements of AASHTO M 288 for temporary silt fence.

2.1.2 Silt Fence Stakes and Posts

The Contractor may use either wooden stakes or steel posts for fence construction. Wooden stakes utilized for silt fence construction, shall have a minimum cross section of 2 inches by 2 inches when oak is used and 4 inches by 4 inches when pine is used, and shall have a minimum length of 3 feet. Steel posts (standard "U" or "T" section) utilized for silt fence construction, shall have a minimum weight of 1.33 pounds per linear foot and a minimum length of 5 feet.

2.1.3 Mill Certificate or Affidavit

A mill certificate or affidavit shall be provided attesting that the geotextile and factory seams meet chemical, physical, and manufacturing requirements specified above. The mill certificate or affidavit shall specify the actual Minimum Average Roll Values and shall identify the fabric supplied by roll identification numbers. The Contractor shall submit a mill certificate or affidavit signed by a legally authorized official from the company manufacturing the geotextile.

2.1.4 Identification Storage and Handling

Geotextile shall be identified, stored and handled in accordance with ASTM D4873/D4873M.

2.1.5 Support Mesh

Support mesh shall be 14-1/2 gage or heavier steel wire with a mesh spacing of 6 by 6 inch or a prefabricated polymeric mesh of equivalent strength.

2.2 Erosion Control Blankets

Installation staple patterns shall be clearly marked on the erosion control blanket with environmentally safe paint.

2.2.1 Netless Erosion Control Blanket

Erosion control blankets shall be a machine-produced mat with a biodegradable agricultural straw matrix (approximately 0.50 lb/sq yd). The blanket shall have a 12-month typical functional longevity and be designed for use on geotechnically stable slopes with gradients up to 1V:4H and channels with shear stresses up to 0.50 pounds per square foot.

2.2.2 Single-Net Erosion Control Blanket

Erosion control blankets shall be a machine-produced mat with a biodegradable agricultural straw matrix (approximately 0.50 lb/sq yd) and photodegradable netting on the top side. The blanket shall be sewn together with degradable thread. The blanket shall have a 12-month

typical functional longevity and be designed for use on geotechnically stable slopes with gradients up to 1V:3H and channels with shear stresses up to 1.50 pounds per square foot.

2.2.3 Double-Net Erosion Control Blanket

Erosion control blankets shall be a machine-produced mat with a biodegradable agricultural straw matrix (approximately 0.50 lb/sq yd) and photodegradable netting on each side. The blanket shall be sewn together with degradable thread. The blanket shall have a 12-month typical functional longevity and be designed for use on geotechnically stable slopes with gradients up to 1V:2H and channels with shear stresses up to 1.75 pounds per square foot.

2.3 Permanent Turf Reinforcement Mat

Turf reinforcement matting shall conform to FHWA FP-03, Section 713, Type 5.A.

2.4 COMPONENTS FOR SEDIMENT TRAP

Coarse aggregate shall conform to ASTM D448, Size 3, 357, or 5. Minor variations from the gradations specified will be permitted. Stone for riprap shall consist of field stone or rough unhewn quarry stone of approximately rectangular shape. The stone shall be hard and angular and of such quality that it will not disintegrate on exposure to water or weathering. The specific gravity of individual stones shall be at least 2.5. Riprap stones shall weigh between 50 and 150 pounds each, except that approximately 10 percent may weigh 50 pounds or less. At least 60 percent shall weight more than 100 pounds. Geotextile shall conform to paragraph GEOTEXTILES.

2.5 COMPONENTS FOR INLET PROTECTION

Aggregates for gravel filter should be sized to get the greatest amount of filtering action possible (by using smaller-sized stone), while not creating significant ponding problems.

2.6 STONE CONSTRUCTION ENTRANCE

Aggregate for construction entrance shall conform to ASTM D448, Size 1. Minor variations from the gradation specified will be permitted. Geotextile shall conform to paragraph GEOTEXTILES.

2.7 ROCK CHECK DAMS

Coarse aggregate shall conform to ASTM D448 size number 1 or approved equal. Riprap shall consist of field stone or rough unhewn quarry stone of approximately rectangular shape. Riprap shall be hard and angular. The specific gravity of individual stones shall be at least 2.5. Concrete rubble may be used provided it has a density of at least 150 pcf. Individual stones shall have a weight of 50 to 150 lbs except that a maximum of 10 percent of stone may weigh less than 50 lbs. At least 60 percent of stones shall weigh more than 100 lbs.

2.8 GEOTEXTILES

Geotextile for other than silt fence shall comply with the requirements of AASHTO M 288 for a separation geotextile.

## PART 3 EXECUTION

### 3.1 INSTALLATION OF SILT FENCES

Silt fences shall extend a minimum of 16 inches above the ground surface and shall not exceed 34 inches above the ground surface. Geotextile shall be from a continuous roll cut to the length of the barrier to avoid the use of joints. When joints are unavoidable, geotextile shall be spliced together at a support post, with a minimum 6 inch overlap, and securely sealed. Silt fence may be installed using either the trench or soil slicing method. Silt fences shall be removed upon approval by the Contracting Officer.

### 3.2 EROSION CONTROL BLANKETS

Installation of erosion control blankets shall conform to the manufacturer's recommendations.

### 3.3 TURF REINFORCEMENT MAT

Installation of turf reinforcement matting shall conform to the manufacturer's recommendations.

### 3.4 Sediment Trap

The area under the embankment shall be cleared, grubbed, and stripped of any vegetation and root mat. Fill material for the embankment shall be placed in accordance with Section 31 00 00 EARTHWORK. A geotextile shall be placed between the riprap and subgrade.

### 3.5 Stone Construction Entrance

The area of the entrance shall be cleared of all vegatation, roots, and other objectionable material. The aggregate layer shall have a minimum total thickness of 6 inches. A geotextile shall be placed beneath aggregate for the full width and length of the entrance. A minimum of 3 inches of the aggregate shall be placed in a cut section to provide stability and secure the geotextile. If conditions on the site are such that the majority of the mud is not removed by the vehicles traveling over the stone, then the tires of the vehicles shall be washed before entering the road. Wash water must be carried away from the entrance to an approved settling area to remove sediment. A wash rack may also be installed for washing of vehicles.

### 3.6 MAINTENANCE

The Contractor shall maintain the temporary and permanent vegetation, erosion and sediment control measures, and other protective measures in good and effective operating condition by performing routine inspections to determine condition and effectiveness, by restoration of destroyed vegetative cover, and by repair of erosion and sediment control measures and other protective measures. The following procedures shall be followed to maintain the protective measures.

#### 3.6.1 Silt Fences

Silt fences shall be inspected in accordance with paragraph INSPECTIONS. Any required repairs shall be made promptly. Close attention shall be

paid to the repair of damaged silt fence resulting from end runs and undercutting. Should the fabric on a silt fence decompose or become ineffective, and the barrier is still necessary, the fabric shall be replaced promptly. Sediment deposits shall be removed when deposits reach one-third of the height of the barrier. When a silt fence is no longer required, it shall be removed. The immediate area occupied by the fence and any sediment deposits shall be shaped to an acceptable grade. The areas disturbed by this shaping shall be seeded in accordance with Section 32 92 19 SEEDING.

3.6.2 Storm Drain Inlet Protection

Inlet protection structures shall be inspected after each rainfall and repairs made as needed. Sediment shall be removed and the trap restored to its original dimensions when the sediment has accumulated to one half the design depth.

3.6.3 Rock Check Dams

Check dams should be checked for sediment after each runoff-producing sotrm event. Sediment should be removed when it reaches one half the original height of the measure.

3.6.4 Stone Construction Entrance

Stone construction entrances shall be maintained in a conditon which will prevent tracking or flow of mud onto paved roads. This may require periodic top dressing with additional stone or the washing and reworking of existing stone as conditions demand and repair and/or cleanout of any structures used to trap sediment. The use of water trucks to remove materials dropped, washed, or tracked onto roadways will not be permitted under any circumstances.

3.6.5 Sediment Traps

Sediment shall be removed and the trap restored to its original dimensions when the sediment has accumulated to one half the design volume of the wet storage. Filter stone shall be regularly checked to ensure that filtration performance is maintained. Stone choked with sediment shall be removed and cleaned or replaced. The structure should be inspected regularly to ensure that it is structurally sound and has not been damaged by erosion or construction equipement. The height of the stone outlet should be inspected to ensure that its center is a least 1 foot below the top of the embankment.

3.6.6 Diversion Dikes

Diversion dikes shall be inspected in accordance with paragraph INSPECTIONS. Close attention shall be paid to the repair of damaged diversion dikes and necessary repairs shall be accomplished promptly. When diversion dikes are no longer required, they shall be shaped to an acceptable grade. The areas disturbed by this shaping shall be seeded in accordance with Section 32 92 19 SEEDING.

3.7 INSPECTIONS

3.7.1 General

The Contractor shall inspect disturbed areas of the construction site,

areas used for storage of materials that are exposed to precipitation that have not been finally stabilized, stabilization practices, structural practices, other controls, and area where vehicles exit the site at least once every seven (7) calendar days and within 24 hours of the end of any storm that produces 0.5 inches or more rainfall at the site. Where sites have been finally stabilized, such inspection shall be conducted at least once every month.

3.7.2 Inspections Details

Disturbed areas and areas used for material storage that are exposed to precipitation shall be inspected for evidence of, or the potential for, pollutants entering the drainage system. Erosion and sediment control measures shall be observed to ensure that they are operating correctly. Discharge locations or points shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters. Locations where vehicles exit the site shall be inspected for evidence of offsite sediment tracking.

3.7.3 Inspection Reports

For each inspection conducted, the Contractor shall prepare a report summarizing the scope of the inspection, name(s) of personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention measures, maintenance performed, and actions taken. The report shall be furnished to the Contracting Officer within 24 hours of the inspection as a part of the Contractor's daily CQC REPORT.

SECTION 01 74 19

CONSTRUCTION AND DEMOLITION WASTE MANAGEMENT
**01/07**

PART 1 GENERAL

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

U.S. GREEN BUILDING COUNCIL (USGBC)

| | |
|---|---|
| LEED BD+C | (2009; R 2010) Leadership in Energy and Environmental Design(tm) Building Design and Construction (LEED-NC) |

1.2 GOVERNMENT POLICY

Government policy is to apply sound environmental principles in the design, construction and use of facilities. As part of the implementation of that policy: (1) practice efficient waste management when sizing, cutting, and installing products and materials and (2) use all reasonable means to divert construction and demolition waste from landfills and incinerators and to facilitate their recycling or reuse. A minimum of 60 percent by weight of total project solid waste shall be diverted from the landfill.

1.3 MANAGEMENT

Develop and implement a waste management program. Take a pro-active, responsible role in the management of construction and demolition waste and require all subcontractors, vendors, and suppliers to participate in the effort. Construction and demolition waste includes products of demolition or removal, excess or unusable construction materials, packaging materials for construction products, and other materials generated during the construction process but not incorporated into the work. In the management of waste consideration shall be given to the availability of viable markets, the condition of the material, the ability to provide the material in suitable condition and in a quantity acceptable to available markets, and time constraints imposed by internal project completion mandates. The Contractor is responsible for implementation of any special programs involving rebates or similar incentives related to recycling of waste. Revenues or other savings obtained for salvage, or recycling accrue to the Contractor. Appropriately permit firms and facilities used for recycling, reuse, and disposal for the intended use to the extent required by federal, state, and local regulations. Also, provide on-site instruction of appropriate separation, handling, recycling, salvage, reuse, and return methods to be used by all parties at the appropriate stages of the project.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation;

submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Waste Management Plan; G, RO

SD-11 Closeout Submittals

Records

1.5 MEETINGS

Conduct Construction Waste Management meetings. After award of the Contract and prior to commencement of work, schedule and conduct a meeting with the Contracting Officer to discuss the proposed Waste Management Plan and to develop a mutual understanding relative to the details of waste management. The requirements for this meeting may be fulfilled during the coordination and mutual understanding meeting outlined in Section 01 45 00.00 10 QUALITY CONTROL. At a minimum, environmental and waste management goals and issues shall be discussed at the following additional meetings:

a. Pre-bid meeting.

b. Preconstruction meeting.

c. Regular QC meetings.

d. Work safety meetings.

1.6 WASTE MANAGEMENT PLAN

A waste management plan shall be submitted within 15 days after notice to proceed and not less than 10 days before the preconstruction meeting. The plan shall demonstrate how the project waste diversion goal shall be met and shall include the following:

a. Name of individuals on the Contractor's staff responsible for waste prevention and management.

b. Actions that will be taken to reduce solid waste generation, including coordination with subcontractors to ensure awareness and participation.

c. Description of the regular meetings to be held to address waste management.

d. Description of the specific approaches to be used in recycling/reuse of the various materials generated, including the areas on site and equipment to be used for processing, sorting, and temporary storage of wastes.

e. Characterization, including estimated types and quantities, of the waste to be generated.

f. Name of landfill and/or incinerator to be used and the estimated costs for use, assuming that there would be no salvage or recycling on the

project.

g. Identification of local and regional reuse programs, including non-profit organizations such as schools, local housing agencies, and organizations that accept used materials such as materials exchange networks and Habitat for Humanity. Include the name, location, and phone number for each reuse facility to be used, and provide a copy of the permit or license for each facility.

h. List of specific waste materials that will be salvaged for resale, salvaged and reused on the current project, salvaged and stored for reuse on a future project, or recycled. Recycling facilities that will be used shall be identified by name, location, and phone number, including a copy of the permit or license for each facility.

i. Identification of materials that cannot be recycled/reused with an explanation or justification, to be approved by the Contracting Officer.

j. Description of the means by which any waste materials identified in item (h) above will be protected from contamination.

k. Description of the means of transportation of the recyclable materials (whether materials will be site-separated and self-hauled to designated centers, or whether mixed materials will be collected by a waste hauler and removed from the site).

l. Anticipated net cost savings determined by subtracting Contractor program management costs and the cost of disposal from the revenue generated by sale of the materials and the incineration and/or landfill cost avoidance.

Revise and resubmit Plan as required by the Contracting Officer. Approval of Contractor's Plan will not relieve the Contractor of responsibility for compliance with applicable environmental regulations or meeting project cumulative waste diversion requirement. Distribute copies of the Waste Management Plan to each subcontractor, the Quality Control Manager, and the Contracting Officer.

## 1.7 RECORDS

Records shall be maintained to document the quantity of waste generated; the quantity of waste diverted through sale, reuse, or recycling; and the quantity of waste disposed by landfill or incineration. Records shall be kept in accordance with the LEED Reference Guide and using the LEED BD+C Letter Template. The records shall be made available to the Contracting Officer during construction, and a copy of the records shall be included in the LEED Documentation Notebook.

## 1.8 COLLECTION

Separate, store, protect, and handle at the site identified recyclable and salvageable waste products in a manner that maximizes recyclability and salvagability of identified materials. Provide the necessary containers, bins and storage areas to facilitate effective waste management and clearly and appropriately identify them. Provide materials for barriers and enclosures around recyclable material storage areas which are nonhazardous and recyclable or reusable. Locate out of the way of construction traffic. Provide adequate space for pick-up and delivery and

convenience to subcontractors. Recycling and waste bin areas are to be kept neat and clean, and recyclable materials shall be handled to prevent contamination of materials from incompatible products and materials. Clean contaminated materials prior to placing in collection containers. Use cleaning materials that are nonhazardous and biodegradable. Handle hazardous waste and hazardous materials in accordance with applicable regulations and coordinate with Section 01 57 20.00 10 ENVIRONMENTAL PROTECTION. Separate materials by one of the following methods:

1.8.1 Source Separated Method.

Waste products and materials that are recyclable shall be separated from trash and sorted as described below into appropriately marked separate containers and then transported to the respective recycling facility for further processing. Deliver materials in accordance with recycling or reuse facility requirements (e.g., free of dirt, adhesives, solvents, petroleum contamination, and other substances deleterious to the recycling process). Separate materials into the following category types as appropriate to the project waste and to the available recycling and reuse programs in the project area:

a. Land clearing debris.

b. Asphalt.

c. Concrete and masonry.

d. Metal (e.g. banding, stud trim, ductwork, piping, rebar, roofing, other trim, steel, iron, galvanized, stainless steel, aluminum, copper, zinc, lead brass, bronze).

    (1) Ferrous.

    (2) Non-ferrous.

e. Wood (nails and staples allowed).

f. Debris.

g. Glass (colored glass allowed).

h. Paper.

    (1) Bond.

    (2) Newsprint.

    (3) Cardboard and paper packaging materials.

i. Plastic.

    (1) Type 1: Polyethylene Terephthalate (PET, PETE).

    (2) Type 2: High Density Polyethylene (HDPE).

    (3) Type 3: Vinyl (Polyvinyl Chloride or PVC).

    (4) Type 4: Low Density Polyethylene (LDPE).

(5) Type 5: Polypropylene (PP).

(6) Type 6: Polystyrene (PS).

(7) Type 7: Other. Use of this code indicates that the package in question is made with a resin other than the six listed above, or is made of more than one resin listed above, and used in a multi-layer combination.

j. Gypsum.

k. Non-hazardous paint and paint cans.

l. Carpet and pads.

m. Ceiling tiles.

n. Insulation.

o. Beverage containers.

1.8.2 Co-Mingled Method.

Waste products and recyclable materials shall be placed into a single container and then transported to a recycling facility where the recyclable materials are sorted and processed.

1.8.3 Other Methods.

Other methods proposed by the Contractor may be used when approved by the Contracting Officer.

1.9 DISPOSAL

Control accumulation of waste materials and trash. Recycle or dispose of collected materials off-site at intervals approved by the Contracting Officer and in compliance with waste management procedures. Except as otherwise specified in other sections of the specifications, disposal shall be in accordance with the following:

1.9.1 Reuse.

First consideration shall be given to salvage for reuse since little or no re-processing is necessary for this method, and less pollution is created when items are reused in their original form. Coordinate reuse with the Contracting Officer. Sale or donation of waste suitable for reuse shall be considered.

1.9.2 Recycle.

Waste materials not suitable for reuse, but having value as being recyclable, shall be made available for recycling. All fluorescent lamps, HID lamps, and mercury-containing thermostats removed from the site shall be recycled. Arrange for timely pickups from the site or deliveries to recycling facilities in order to prevent contamination of recyclable materials.

1.9.3 Compost

Consider composting on site if a reasonable amount of compostable material will be available. Compostable materials include plant material, sawdust, and certain food scraps.

1.9.4 Waste.

Materials with no practical use or economic benefit shall be disposed at a landfill or incinerator.

1.9.5 Return

Set aside and protect misdelivered and substandard products and materials and return to supplier for credit.

SECTION 01 78 23

OPERATION AND MAINTENANCE DATA
**07/06**

PART 1 GENERAL

1.1 SUBMISSION OF OPERATION AND MAINTENANCE DATA

Submit Operation and Maintenance (O&M) Data specifically applicable to this contract and a complete and concise depiction of the provided equipment, product, or system, stressing and enhancing the importance of system interactions, troubleshooting, and long-term preventative maintenance and operation. The subcontractors shall compile and prepare data and deliver to the Contractor prior to the training of Government personnel. The Contractor shall compile and prepare aggregate O&M data including clarifying and updating the original sequences of operation to as-built conditions. Organize and present information in sufficient detail to clearly explain O&M requirements at the system, equipment, component, and subassembly level. Include an index preceding each submittal. Submit in accordance with this section and Section 01 33 00 SUBMITTAL PROCEDURES.

1.1.1 Package Quality

Documents must be fully legible. Poor quality copies and material with hole punches obliterating the text or drawings will not be accepted.

1.1.2 Package Content

Data package content shall be as shown in the paragraph titled "Schedule of Operation and Maintenance Data Packages." Comply with the data package requirements specified in the individual technical sections, including the content of the packages and addressing each product, component, and system designated for data package submission, except as follows. Commissioned items without a specified data package requirement in the individual technical sections shall use Data Package 3. Commissioned items with a Data Package 1 or 2 requirement shall use instead Data Package 3.

1.1.3 Changes to Submittals

Manufacturer-originated changes or revisions to submitted data shall be furnished by the Contractor if a component of an item is so affected subsequent to acceptance of the O&M Data. Changes, additions, or revisions required by the Contracting Officer for final acceptance of submitted data, shall be submitted by the Contractor within 30 calendar days of the notification of this change requirement.

1.1.4 Review and Approval

The Contractor's Commissioning Authority (CA) shall review the commissioned systems and equipment submittals for completeness and applicability. The CA shall verify that the systems and equipment provided meet the requirements of the Contract documents and design intent, particularly as they relate to functionality, energy performance, water performance, maintainability, sustainability, system cost, indoor environmental quality, and local environmental impacts. The CA shall

communicate deficiencies to the Contracting Officer. Upon a successful review of the corrections, the CA shall recommend approval and acceptance of these O&M manuals to the Contracting Officer. This work shall be in addition to the normal review procedures for O&M data.

1.1.5 O&M Database

Develop a database from the O&M manuals that contains the information required to start a preventative maintenance program.

1.2 TYPES OF INFORMATION REQUIRED IN O&M DATA PACKAGES

1.2.1 Operating Instructions

Include specific instructions, procedures, and illustrations for the following phases of operation for the installed model and features of each system:

1.2.1.1 Safety Precautions

List personnel hazards and equipment or product safety precautions for all operating conditions.

1.2.1.2 Operator Prestart

Include procedures required to install, set up, and prepare each system for use.

1.2.1.3 Startup, Shutdown, and Post-Shutdown Procedures

Provide narrative description for Startup, Shutdown and Post-shutdown operating procedures including the control sequence for each procedure.

1.2.1.4 Normal Operations

Provide narrative description of Normal Operating Procedures. Include Control Diagrams with data to explain operation and control of systems and specific equipment.

1.2.1.5 Emergency Operations

Include Emergency Procedures for equipment malfunctions to permit a short period of continued operation or to shut down the equipment to prevent further damage to systems and equipment. Include Emergency Shutdown Instructions for fire, explosion, spills, or other foreseeable contingencies. Provide guidance and procedures for emergency operation of all utility systems including required valve positions, valve locations and zones or portions of systems controlled.

1.2.1.6 Operator Service Requirements

Include instructions for services to be performed by the operator such as lubrication, adjustment, inspection, and recording gage readings.

1.2.1.7 Environmental Conditions

Include a list of Environmental Conditions (temperature, humidity, and other relevant data) that are best suited for the operation of each product, component or system. Describe conditions under which the item

equipment should not be allowed to run.

1.2.2 Preventive Maintenance

Include the following information for preventive and scheduled maintenance to minimize corrective maintenance and repair for the installed model and features of each system. Include potential environmental and indoor air quality impacts of recommended maintenance procedures and materials.

1.2.2.1 Lubrication Data

Include preventative maintenance lubrication data, in addition to instructions for lubrication provided under paragraph titled "Operator Service Requirements":

a. A table showing recommended lubricants for specific temperature ranges and applications.

b. Charts with a schematic diagram of the equipment showing lubrication points, recommended types and grades of lubricants, and capacities.

c. A Lubrication Schedule showing service interval frequency.

1.2.2.2 Preventive Maintenance Plan and Schedule

Include manufacturer's schedule for routine preventive maintenance, inspections, tests and adjustments required to ensure proper and economical operation and to minimize corrective maintenance. Provide manufacturer's projection of preventive maintenance work-hours on a daily, weekly, monthly, and annual basis including craft requirements by type of craft. For periodic calibrations, provide manufacturer's specified frequency and procedures for each separate operation.

1.2.3 Corrective Maintenance (Repair)

Include manufacturer's recommended procedures and instructions for correcting problems and making repairs.

1.2.3.1 Troubleshooting Guides and Diagnostic Techniques

Include step-by-step procedures to promptly isolate the cause of typical malfunctions. Describe clearly why the checkout is performed and what conditions are to be sought. Identify tests or inspections and test equipment required to determine whether parts and equipment may be reused or require replacement.

1.2.3.2 Wiring Diagrams and Control Diagrams

Wiring diagrams and control diagrams shall be point-to-point drawings of wiring and control circuits including factory-field interfaces. Provide a complete and accurate depiction of the actual job specific wiring and control work. On diagrams, number electrical and electronic wiring and pneumatic control tubing and the terminals for each type, identically to actual installation configuration and numbering.

1.2.3.3 Maintenance and Repair Procedures

Include instructions and a list of tools required to repair or restore the product or equipment to proper condition or operating standards.

1.2.3.4 Removal and Replacement Instructions

Include step-by-step procedures and a list required tools and supplies for removal, replacement, disassembly, and assembly of components, assemblies, subassemblies, accessories, and attachments. Provide tolerances, dimensions, settings and adjustments required. Instructions shall include a combination of text and illustrations.

1.2.3.5 Spare Parts and Supply Lists

Include lists of spare parts and supplies required for maintenance and repair to ensure continued service or operation without unreasonable delays. Special consideration is required for facilities at remote locations. List spare parts and supplies that have a long lead-time to obtain.

1.2.4 Corrective Maintenance Work-Hours

Include manufacturer's projection of corrective maintenance work-hours including requirements by type of craft. Corrective maintenance that requires completion or participation of the equipment manufacturer shall be identified and tabulated separately.

1.2.5 Appendices

Provide information required below and information not specified in the preceding paragraphs but pertinent to the maintenance or operation of the product or equipment. Include the following:

1.2.5.1 Product Submittal Data

Provide a copy of all SD-03 Product Data submittals required in the applicable technical sections.

1.2.5.2 Manufacturer's Instructions

Provide a copy of all SD-08 Manufacturer's Instructions submittals required in the applicable technical sections.

1.2.5.3 O&M Submittal Data

Provide a copy of all SD-10 Operation and Maintenance Data submittals required in the applicable technical sections.

1.2.5.4 Parts Identification

Provide identification and coverage for all parts of each component, assembly, subassembly, and accessory of the end items subject to replacement. Include special hardware requirements, such as requirement to use high-strength bolts and nuts. Identify parts by make, model, serial number, and source of supply to allow reordering without further identification. Provide clear and legible illustrations, drawings, and exploded views to enable easy identification of the items. When illustrations omit the part numbers and description, both the illustrations and separate listing shall show the index, reference, or key number that will cross-reference the illustrated part to the listed part. Parts shown in the listings shall be grouped by components, assemblies, and subassemblies in accordance with the manufacturer's standard

practice. Parts data may cover more than one model or series of equipment, components, assemblies, subassemblies, attachments, or accessories, such as typically shown in a master parts catalog

1.2.5.5 Warranty Information

List and explain the various warranties and clearly identify the servicing and technical precautions prescribed by the manufacturers or contract documents in order to keep warranties in force. Include warranty information for primary components such as the compressor of air conditioning system.

1.2.5.6 Personnel Training Requirements

Provide information available from the manufacturers that is needed for use in training designated personnel to properly operate and maintain the equipment and systems.

1.2.5.7 Testing Equipment and Special Tool Information

Include information on test equipment required to perform specified tests and on special tools needed for the operation, maintenance, and repair of components.

1.2.5.8 Testing and Performance Data

Include completed prefunctional checklists, functional performance test forms, and monitoring reports. Include recommended schedule for retesting and blank test forms.

1.2.5.9 Contractor Information

Provide a list that includes the name, address, and telephone number of the General Contractor and each Subcontractor who installed the product or equipment, or system. For each item, also provide the name address and telephone number of the manufacturer's representative and service organization that can provide replacements most convenient to the project site. Provide the name, address, and telephone number of the product, equipment, and system manufacturers.

1.3 TYPES OF INFORMATION REQUIRED IN CONTROLS O&M DATA PACKAGES

Include Data Package 5 and the following for control systems:

a. Narrative description on how to perform and apply all functions, features, modes, and other operations, including unoccupied operation, seasonal changeover, manual operation, and alarms. Include detailed technical manual for programming and customizing control loops and algorithms.

b. Full as-built sequence of operations.

c. Copies of all checkout tests and calibrations performed by the Contractor (not Cx tests).

d. Full points list. A listing of rooms shall be provided with the following information for each room:

(1) Floor

(2) Room number

(3) Room name

(4) Air handler unit ID

(5) Reference drawing number

(6) Air terminal unit tag ID

(7) Heating and/or cooling valve tag ID

(8) Minimum cfm

(9) Maximum cfm

e. Full print out of all schedules and set points after testing and acceptance of the system.

f. Full as-built print out of software program.

g. Electronic copy on disk or CD of the entire program for this facility.

h. Marking of all system sensors and thermostats on the as-built floor plan and mechanical drawings with their control system designations.

1.4 SCHEDULE OF OPERATION AND MAINTENANCE DATA PACKAGES

Furnish the O&M data packages specified in individual technical sections. The required information for each O&M data package is as follows:

1.4.1 Data Package 1

a. Safety precautions

b. Cleaning recommendations

c. Maintenance and repair procedures

d. Warranty information

e. Contractor information

f. Spare parts and supply list

1.4.2 Data Package 2

a. Safety precautions

b. Normal operations

c. Environmental conditions

d. Lubrication data

e. Preventive maintenance plan and schedule

f. Cleaning recommendations

g. Maintenance and repair procedures

h. Removal and replacement instructions

i. Spare parts and supply list

j. Parts identification

k. Warranty information

l. Contractor information

1.4.3 Data Package 3

a. Safety precautions

b. Operator prestart

c. Startup, shutdown, and post-shutdown procedures

d. Normal operations

e. Emergency operations

f. Environmental conditions

g. Lubrication data

h. Preventive maintenance plan and schedule

i. Cleaning recommendations

j. Troubleshooting guides and diagnostic techniques

k. Wiring diagrams and control diagrams

l. Maintenance and repair procedures

m. Removal and replacement instructions

n. Spare parts and supply list

o. Product submittal data

p. O&M submittal data

q. Parts identification

r. Warranty information

s. Testing equipment and special tool information

t. Testing and performance data

u. Contractor information

1.4.4 Data Package 4

a. Safety precautions

b. Operator prestart

c. Startup, shutdown, and post-shutdown procedures

d. Normal operations

e. Emergency operations

f. Operator service requirements

g. Environmental conditions

h. Lubrication data

i. Preventive maintenance plan and schedule

j. Cleaning recommendations

k. Troubleshooting guides and diagnostic techniques

l. Wiring diagrams and control diagrams

m. Maintenance and repair procedures

n. Removal and replacement instructions

o. Spare parts and supply list

p. Corrective maintenance man-hours

q. Product submittal data

r. O&M submittal data

s. Parts identification

t. Warranty information

u. Personnel training requirements

v. Testing equipment and special tool information

w. Testing and performance data

x. Contractor information

1.4.5 Data Package 5

a. Safety precautions

b. Operator prestart

c. Start-up, shutdown, and post-shutdown procedures

d. Normal operations

e. Environmental conditions

f. Preventive maintenance plan and schedule

g. Troubleshooting guides and diagnostic techniques

h. Wiring and control diagrams

i. Maintenance and repair procedures

j. Removal and replacement instructions

k. Spare parts and supply list

l. Product submittal data

m. Manufacturer's instructions

n. O&M submittal data

o. Parts identification

p. Testing equipment and special tool information

q. Warranty information

r. Testing and performance data

s. Contractor information

SECTION 01 78 24.00 10

FACILITY DATA REQUIREMENTS
**05/18**

PART 1 GENERAL

This specification requires the collection, organization, and turnover of electronic Facility Data for specific assets designed and constructed as part of this contract. Provide a Facility Document Set (FDS) and Facility Data Workbook (FDW) as defined in this specification. See Sections 01 33 00 SUBMITTAL PROCEDURES and 01 78 23 OPERATION AND MAINTENANCE DATA, for additional Facility Data delivery requirements.

1.1 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

INTERNATIONAL ORGANIZATION FOR STANDARDIZATION (ISO)

| | |
|---|---|
| ISO 19005-3 | (2012) Document Management -- Electronic Document File Format for Long-Term Preservation -- Part 3: Use of ISO 32000-1 with Support for Embedded Files (PDF/A-3) |
| ISO 32000-1 | (2008) Document Management -- Portable Document Format -- Part 1: PDF 1.7 |

1.2 DEFINITIONS AND ABBREVIATIONS

1.2.1 Assets

Assets are specific items of property or equipment.

1.2.2 Attributes

Attributes are individual pieces of Facility Data that describe facilities and their associated assets.

1.2.3 Facility Data

Information defined and collected in the Facility Data Workbook (FDW) and Facility Document Set (FDS).

1.2.4 Facility Document Set (FDS)

An electronically compiled and organized document containing the supporting documents and data used to populate the Facility Data Workbook during its respective phase of development.

a. For construction-based deliverables, the FDS is comprised of the project Operation and Maintenance Data Packages and Government-Approved Record drawings.

1.2.5 Facility Data Workbook (FDW)

A pre-formatted spreadsheet template used to compile Asset, Attribute, Facility, and Space Data that the Government wishes to manage via electronic means. The FDW also contains all requirements associated with proper collection, organization, and turnover of the Facility Data.

1.2.6 Facility Data Project Execution Plan (FDPxP)

A document that describes the clear and organized plan for the collection, organization, and turnover of the Facility Data deliverables required by this specification. The Contractor may consolidate BIM PxP requirements defined in 01 33 39.00 10 ADVANCED MODELING REQUIREMENTS and FDPxP requirements defined herein and integrate them into a single, consolidated BIM/Facility Data PxP for Government approval.

1.3 UNITS OF MEASURE

Provide Facility Data deliverables utilizing the units of measure

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Facility Data Project Execution Plan (FDPxP)

SD-10 Operation and Maintenance Data

Facility Data Workbook, Construction Progress; G, DO

Facility Document Set, Construction Progress; G, DO

SD-11 Closeout Submittals

Facility Data Workbook, Construction Final; G, DO

Facility Document Set, Construction Final; G, DO

1.5 QUALITY ASSURANCE

1.5.1 Facility Data Project Execution Plan (FDPxP)

Provide the Government with a plan for the collection, organization, and turnover of the Facility Data deliverables to the Government. At a minimum, include the following items in the FDPxP:

1.5.1.1 Front Matter

Provide a Cover Page, Table of Contents, and Executive Summary/Objectives.

1.5.1.2 Project Information

List the Project Owner, Project Name, Project Location and address, Contract Type, Project Description, Project/Contract Number, Project Milestones.

1.5.1.3 Submittal Schedule

Identify delivery schedule for all deliverables in compliance with the submission requirements identified in this specification.

1.5.1.4 Personnel

Identify key personnel involved in the development of the Facility Data deliverables including Contractor and Government personnel.

1.5.1.5 Facility Data Workbook(s)

Identify Facility and Space Data as applicable at time of FDPxP submission. Individually list every asset group from the FDW Requirements that will require Facility Data collection. No attribute data is required at this time. Identify any asset groups from the FDW Requirements that are not required within the scope of this Contract. Document the version of FDW to be used through the duration of the project.

1.5.1.6 Facility Document Set(s)

Define structure and format of the submittal. Provide a comprehensive outline of the final FDS to be delivered. Organize the outline with headings, titles, and descriptions such that the Government may ascertain that working documents comply with the formatting requirements defined by this specification.

1.5.1.7 Protocols

Detailed procedures:

a. Facility Data documentation/collection process.

b. Facility Document Set production/development process.

c. Collaboration procedures including strategy, meetings, communication, and subcontractor/consultant involvement.

d. Quality Control, including site verification of FDW, as applicable.

e. File and folder naming structure.

f. Hardware and software being used for collection and organization of Facility Data. Identify type, format, and anticipated organization of digital storage media to be provided as part of required deliverables. Include means and methods for checking deliverables for malicious content.

1.5.2 Meetings

To assure that Facility Data requirements are being met through the duration of the project, organize the following meetings and discuss the subsequent topics:

1.5.2.1 Pre-Construction Meeting

At a minimum, discuss the following:

a. The requirement for Facility Data deliverables under this contract.

b. Primary roles and responsibilities associated with the development and delivery of the Facility Data deliverables, and.

c. Identify and agree upon a date and attendance list for the meetings described below:

1.5.2.2 FDPxP Coordination Meeting

a. Facilitate a meeting following submission and Government review of the FDPxP. Include the Facility Data Preparer(s),, Quality Control (QC) Manager, Commissioning Authority (CA), Government's Facility Data Proponent, Contracting Officer's Representative, and Directorate of Public Works (DPW) Facilities Management Specialist (FMS).

b. The purpose of this meeting is to coordinate the efforts necessary by contract parties to ensure an accurate collection, preparation, quality control, and submittal of these deliverables.

c. The FDPxP serves as the primary agenda for this meeting. At a minimum, discuss the following:

(1) Processes and methods of gathering facility data during construction. Discuss and obtain special permissions and/or waivers as necessary (photo waivers, data encryption, etc.);

(2) Contractor Quality Control practices and procedures;

(3) Corrective actions necessary for Government approval of FDPxP;

(4) Necessity for additional or recurring Facility Data Coordination Meetings outside of those required by this specification, as requested by the Contractor. Intent of these meetings would be to maintain regular contact between responsible parties of the Contractor and Government with regard to development of the facility data deliverables. Conduct status meetings with a frequency agreed upon at this meeting.

1.5.2.3 Submittal Coordination Meeting

a. Facilitate a meeting following submission and Government review of each design or progress submittal of the Facility Data. Include the Facility Data Preparer(s), Designer of Record (DOR), Quality Control (QC) Manager, Commissioning Authority (CA), Government's Facility Data Proponent, Contracting Officer's Representative, and Directorate of Public Works (DPW) Facilities Management Specialist (FMS). Include Mechanical, Electrical, Plumbing, and Fire Protection subcontractors as applicable.

b. The purpose of this meeting is to demonstrate ongoing compliance with the requirements identified in this specification.

c. The applicable deliverables, along with Government remarks associated

with review of these submittals serve as the primary guide and agenda for this meeting. At a minimum, discuss the following during this meeting:

(1) Review assets, applicable attributes, facility, and space data in FDW at time of submittal;

(2) Demonstrate Quality Control and site verification procedures, as applicable, by Contractor QC;

(3) Review contents and organization of FDS at time of submittal;

(4) Discuss Government review comments and/or unresolved items preventing completion and Government approval of the Facility Data Workbook and Facility Document Set.

1.5.3 Facility Turnover and Contract Closeout

Include the Facility Document Set, Construction Final as a deliverable in Facility Turnover and Contract Closeout procedures as defined in 01 78 39.00 24 AS-BUILT DRAWINGS.

1.5.4 Facility Data Workbook Quality Requirements

For each submittal, ensure that the information contained in the FDW(s) reflects the minimum content requirements defined in the PART 3 EXECUTION portion of this section. Ensure that information provided as part of the FDW(s) conforms to the standards described below:

a. Compile FDW(s) using approved spreadsheet templates. Do not alter the formatting or organizational layout of the templates in any way. For this Contract, templates are available for download from the USACE CAD/BIM Technology Center website, site information provided in the PART 2 PRODUCTS portion of this section.

b. Instructions for the proper maintenance and completion of these FDWs are contained in the FDW Requirements contained within the FDW template.

1.5.5 Facility Document Set Quality Requirements

Ensure that information provided as part of each FDS conforms to the electronic and data formatting standards identified below:

1.5.5.1 Document Files

Utilize PDF file format in accordance with ISO 32000-1 and ISO 19005-3 for all document-based files. Provide files from original sources, text-searchable, and saved in "Standard" (uncompressed) resolution. Bookmark and label files as defined in the PART 2 PRODUCTS portion of this section.

1.5.5.2 Photograph Files

If photographs are required, utilize JPEG file format for all photograph and image files. Provide full-color photos with photo resolution of not less than 4 megapixels and not more than 12 megapixels.

Provide a copy of any installation-specific letters or waivers allowing

permission to take installed equipment photographs on this Contract. Waivers need not be attached to every photo, only one copy of each permission letter need be included in the Government deliverables.

1.5.5.3 Drawing Files

Provide all drawings required by this specification in full-size PDF format in accordance with ISO 32000-1 and ISO 19005-3. Produce PDF files from original sources, text-searchable, and saved in "Standard" (uncompressed) resolution whenever possible. Bookmark and label files as defined in the PART 2 PRODUCTS portion of this section.

Submission of scanned or photocopied drawing files is prohibited. Only vector-preserved PDF files are acceptable.

1.5.6 Facility Document Set Integrity Requirements

Ensure that information provided as part of each FDS conforms to the integrity standards identified below:

1.5.6.1 File Protection

Do not restrict data files, document files or photographic files from being printed, exported, modified or copied. Do not deliver files with any restrictions (expiration date, locks, etc.) for access, viewing, archiving, or editing.

1.5.6.2 Manufacturer-Specific Documents

Provide text-searchable, vector-based document files from the manufacturer's online or electronic documentation. Color documents are preferred. Provide documents specific to the product(s) installed under this Contract. When possible, do not submit document files containing multiple product catalogs from the same manufacturer, or product data from multiple manufacturers in the same file. Provide documents directly from the manufacturer whenever possible. Do not provide scanned copies of hardcopy documents.

1.6 DELIVERY, STORAGE, AND HANDLING

Deliver facility data submittals in an organized and legible manner. Provide submittals adhering to the requirements of of 01 33 00 SUBMITTAL REQUIREMENTS and 01 78 23 OPERATION AND MAINTENANCE DATA.

1.6.1 Number of Copies

Provide three identical copies of disks for approval; for each submittal and each facility required. Provide on approved electronic media (one copy per disk or set of disks) as defined below. Provide submittal files on electronic storage media in compliance with the quality requirements identified in this specification.

1.6.2 Malicious Content

Scan all files for malicious viruses using a commercially available scanning program that is routinely updated to identify and remove current virus threats.

1.6.3 Storage Media

Provide facility data on disk-based (DVD-R/RW) media. Any deviations from the required storage media must be approved by the Government. Select and apply technology used for electronic data transmission to ensure that the full Facility Data submittal for each facility is provided on one single disk, whenever possible. When separation of the submittal is required, first separate the FDS and the FDW onto separate media. Second, separate FDS into logical segments or components. Any further divisions must be documented in the FDPxP and approved by the Government.

Provide Facility Data on disk-based (DVD-R/RW) media. Any deviations from the required storage media shall be approved by the Government. Select and apply technology used for electronic data transmission to ensure that the full Facility Data submittal for each facility is provided on one single disk, whenever possible. When separation of the submittal is required, first separate the FDS and the FDW onto separate media. Second, separate FDS into logical segments or components. Any further divisions must be documented in the FDPxP and approved by the Government.

a. Apply a label directly printed to storage media. Do not provide adhesive, paper-based labels. List the name of the facility, Project, Project location, Contract number, Designer of Record firm/Prime Contractor company's name, title of submission, and security classification (in accordance with the appropriate security classification labeling regulations) on the label. If multiple disks are provided, clearly document the contents of each disk on the label.

b. Include the name and contact information of the individual who produced the final data disk to ensure that any problems with the data or media can be easily resolved.

c. When browsed on any computer, the disk shall display the following folders and their associated content:

(1) Facility Data Workbook (containing 1 FDW per facility);
(2) Facility Document Set (containing 1 FDS per facility);
(3) FDPxP (containing 1 PxP per contract);
(4) Readme (Containing 1 TXT, PDF, or HTML file with general use information, organizational instructions, and basic preparer contact information. Include all information included on the storage media label).

PART 2 PRODUCTS

2.1 FACILITIES

Facilities that require individual (separate and complete) Facility Data deliverables as described in this specification are as follows:

a. Fire Station Support Building (AM 0002)

2.2 FACILITY DATA WORKBOOK(S)

Provide one compiled FDW for each facility identified above. Complete all portions of each FDW including facility, space, asset, and attribute data in compliance with the FDW Requirements. The current FDW template (.xlsm format) shall be downloaded from the USACE CAD/BIM Technology Center website at https://cadbimcenter.erdc.dren.mil.

2.2.1 Spaces

Provide data for all applicable spaces in the facility. Minimum space definitions are as follows:

a. Provide all rooms as defined in the design documents.
b. If not otherwise defined, provide a minimum of one "roof" space in the FDW.
c. If not otherwise defined, provide a minimum of one "site" space in the FDW.
d. Provide all spaces not otherwise described, but necessary to accurately indicate the location of all FDW assets required by this specification.

2.2.2 Assets

a. Compile an FDW that contains the maintainable and warrantable equipment (assets) associated with each facility. This includes assets in contract scope and within the project extents. See 01 78 23 OPERATION AND MAINTENANCE DATA for related requirements. Assets shall include but are not limited to those types described in the "Required Assets" portion of the FDW template and any additional assets defined in the FDPxP. FDW asset entries shall be individually itemized (instance-based). Entries indicative of multiple assets (type-based) are not allowed.

Assets applicable to the scope of this project shall be documented in the FDPxP.

b. Sub-component assets that are an integral and functional part of another component (e.g. An electric motor that serves as part of an air-handling unit) need not be duplicated or listed separately as its own asset.

c. Definitions, descriptions, and formatting requirements for these assets can be found in the FDW Requirements contained within the FDW template.

d. If an asset type is not included in the scope of the Project, no Facility Data (assets or attributes) are to be included in the FDW (even as a placeholder) for that asset type.

2.2.3 Attributes

a. Populate each individual asset with all required attributes defined in the "Required Attributes" portion of the FDW template.

b. Definitions, descriptions, and formatting requirements for these attributes can be found in the FDW Requirements contained within the FDW template.

c. If an attribute is not applicable, populate that field with "N/A." Do not leave it blank.

2.3 FACILITY DOCUMENT SET

2.3.1 Organization

Organize the FDS in a hierarchical manner as follows. Use electronic

bookmarks to create an easily navigable document. The first and primary hierarchical level must contain the following bookmarks:

a. "O&M Data" - See subordinate hierarchical requirements in the "O&M DATA HIERARCHY" paragraph.

b. "Record Drawings" - See subordinate hierarchical requirements in paragraph RECORD DRAWINGS HIERARCHY.

2.3.1.1 O&M Data Hierarchy

Under "O&M Data" provide all Government-Approved O&M Data Packages as defined in 01 78 23 OPERATION AND MAINTENANCE DATA and as required by technical specifications contained within this contract. Further organize this information under the following hierarchical levels:

a. The contract specification and title under which the Data Package and the associated equipment or system references. (e.g. 26 23 00.00 40 - SWITCHBOARDS AND SWITCHGEAR)

b. The Data Package Number as defined in 01 78 23 OPERATION AND MAINTENANCE DATA. (e.g. Data Package 2)

2.3.1.2 Record Drawings Hierarchy

Under "Record Drawings" provide an electronic copy of the Government-Approved record drawings, as specified in 01 78 39.00 24 AS-BUILT DRAWINGS, for the project in PDF format. Further group discipline sheets under the following hierarchical levels:

a. The full discipline heading represented by the contents of the sheet and as shown in the Record Drawing Sheet Index. Organize these headings in the order that the drawings set is organized. (General, Civil, Structural, Architectural, Interiors, Plumbing, Mechanical, Electrical, Telecommunications, etc.)

b. The Sheet ID and Sheet Name as found in the Record Drawing Sheet Index and in accordance with the AEC CAD Standard referenced in 01 78 39.00 24 AS-BUILT DRAWINGS. (e.g. G-001 - LEGEND; CS101 - SITE PLAN AREA 101; A-101 - OVERALL FIRST FLOOR PLAN; P-601 - FIRST FLOOR DWS WATER RISER DIAGRAM, etc.)

PART 3 EXECUTION

3.1 CONSTRUCTION PROGRESS SUBMITTALS

Submit the FDW and FDS construction progress submittals together. Meet the following completeness and formatting requirements listed below:

a. Provide Facility Data Workbook, Construction Progress submittal(s) when all assets are identified, but not later than 60 days prior to Beneficial Occupancy Date (BOD) as identified in the Government-Approved construction schedule. Clearly identify any assets or asset groups missing in the "variations" section of the ENG Form 4025 Transmittal Form provided with the submittal. Populate assets with any front-loaded attribute data that is available at the time of asset input. See the FDW Requirements contained within the FDW template for a list of attributes to be completed for this submittal.

b. Submit individual FDW templates for each facility identified in the "FACILITIES" paragraph. While FDWs are not required to be complete for this submittal, any data provided shall be accurate and formatted correctly according to the FDW Requirements.

c. Submit a sample or working Facility Document Set, Construction Progress submittal containing "draft" or "example" documents that are organized in the manner defined by this specification. Draft or example documents need not be technically accurate or complete in their content, but defined and separated in a manner such that all organizational and formatting requirements defined by this specification may be evaluated.

## 3.2 CONSTRUCTION FINAL SUBMITTALS

Submit the FDW and FDS construction final submittals as they are completed. Coordinate the Facility Data Workbook, Construction Final submittal with data verification procedures as defined in the accepted FDPxP. Provide the Facility Document Set, Construction Final submittal only after Government acceptance of its individual components as defined by 01 78 39.00 24 AS-BUILT DRAWINGS and 01 78 23 OPERATION AND MAINTENANCE DATA.

## 3.3 FACILITY DATA WORKBOOK VERIFICATION

Verify the FDW through the quality control personnel and procedures as defined in the FDPxP. One-hundred percent accuracy of FDW information is required for Government acceptance of the Facility Data Workbook, Construction Final submittal.

SECTION 01 78 36.00 24

WARRANTY OF CONSTRUCTION
**4/07**

PART 1 GENERAL

1.1 WARRANTY OF CONSTRUCTION

(a) Foremost and in addition to any other warranties in this contract, the Contractor warrants, except as provided in paragraph (i) of this clause, that work performed under this contract conforms to the contract requirements and is free of any defect in equipment, material, design furnished, or workmanship performed by the Contractor or any subcontractor or supplier at any tier.

(b) This warranty shall continue for a period of 1 year from the date of final acceptance of the work. If the Government takes possession of any part of the work before final acceptance, this warranty shall continue for a period of 1 year from the date the Government takes possession.

(c) The Contractor shall remedy at the Contractor's expense any failure to conform, or any defect. In addition, the Contractor shall remedy at the Contractor's expense any damage to Government-owned or controlled real or personal property, when that damage is the result of--

(1) The Contractor's failure to conform to contract requirements; or

(2) Any defect of equipment, material, workmanship, or design furnished by the Contractor.

(d) The Contractor shall restore any work damaged in fulfilling the terms and conditions of this clause.

(e) The Contractor's warranty with respect to work restored, repaired or replaced will run for 1 year from the date of restoration, repair or replacement. This provision applies equally to all items restored, repaired, or replaced under paragraph (c) and (d) above.

(f) The Government will notify the Contractor, in writing, within a reasonable time after the discovery of any failure, defect, or damage. Repair work necessary to correct a warranty condition which arises to threaten the health or safety of personnel, the physical safety of property or equipment, or which impairs operations, habitability of living spaces, etc., will be performed by the Contractor on an immediate basis as directed verbally by the Government. Written verification will follow verbal instruction.

(g) If the Contractor fails to remedy any failure, defect, or damage within a reasonable time after receipt of verbal or written notice, the Government shall have the right to replace, repair, or otherwise remedy the failure, defect, or damage at the Contractor's expense.

(h) With respect to all warranties, express or implied, from subcontractors, manufacturers, or suppliers for work performed and materials furnished under this contract, the Contractor shall--

(1) Obtain all warranties that would be given in normal commercial practice;

(2) Require all warranties to be executed, in writing, for the benefit of the Government, if directed by the Contracting Officer; and

(3) Enforce all warranties for the benefit of the Government, if directed by the Contracting Officer.

(i) In the event the Contractor's warranty under paragraph (b) of this clause has expired, the Government may bring suit at its expense to enforce a subcontractor's, manufacturer's, or supplier's warranty.

(j) Unless a defect is caused by the negligence of the Contractor or subcontractor or supplier at any tier, the Contractor shall not be liable for the repair of any defects of material or design furnished by the Government nor for the repair of any damage that results from any defect in Government-furnished material or design.

(k) This warranty shall not limit the Government's rights under the Inspection and Acceptance clause of this contract with respect to latent defects, gross mistakes, or fraud.

(l) The Prime Contractor, Government, and customer's representative shall conduct a joint warranty inspection at 4 and 9 months after acceptance. The inspection shall review the previous corrections and response times, open items, upcoming scheduled corrections, site investigations, and any other issues.

1.2 ADDITIONAL WARRANTY REQUIREMENTS

1.2.1 Performance Bond

(a) It is understood that the Contractor's Performance Bond will remain effective for one (1) year from the date of acceptance.

(b) If either the Contractor or his representative doesn't diligently pursue warranty work to completion, the contractor and surety will be liable for all costs. The Government, at its option, will either have the work performed by others or require the surety to have it done. Both direct and administrative costs will be reimbursable to the Government.

1.2.2 Pre-Warranty Conference

(a) Prior to contract completion and at a time designated by the Contracting Officer or his authorized representative, the Contractor shall meet with the Contracting Officer or his authorized representative to develop a mutual understanding with respect to the requirements of the Paragraph: WARRANTY OF CONSTRUCTION. Communication procedures for Contractor notification of warranty defects, priorities with respect to the type of defect and other details deemed necessary by the Contracting Officer or his authorized

representative for the execution of the construction warranty shall be established/reviewed at this meeting.

(b) In connection with these requirements and at the time of the Contractor's quality control completion inspection, the Contractor will furnish the name, telephone number and address of the service representative which is authorized to initiate and pursue warranty work action on behalf of the Contractor and surety. This single point of contact will be located within the local service area of the warranted construction, will be continuously available, and will be responsive to Government inquiry on warranty work action and status. This requirement does not relieve the Contractor of any Contractual responsibilities in connection with the paragraph: WARRANTY OF CONSTRUCTION.

(c) Local service area is defined as the area in which the contractor or his representative can meet the response times as described in paragraph 1.2.4 and in any event shall not exceed 200 miles radius of the construction site.

1.2.3 Equipment Warranty Identification

The Contractor shall provide warranty identification tags on all mechanical and electrical equipment installed under this contract. Tags and installation shall be in accordance with the requirements of Paragraph: EQUIPMENT WARRANTY IDENTIFICATION TAGS.

1.2.4 Warranty Service Calls

The Contractor or his local service representative will respond to the site, to a call within the time periods as follows: Four (4) hours for Heating, Air Conditioning, Refrigeration, Air Supply and Distribution, Critical Electrical service Systems and Food Service Equipment and Twenty-Four (24) hours For All Other Systems.

1.2.5 Equipment Warranty Booklet

At or before 30 days prior to final inspection and acceptance of the work, the Contractor shall submit the data mentioned as follows:

The Contractor shall provided a Booklet, which consists of a listing of all equipment items (see paragraphs a. and b. below) which are specified to be guaranteed along with the warranty papers for each piece of equipment. Three (3) legible bound copies of the booklet shall be submitted for approval and shall be indexed alphabetically by equipment type. For each specific guaranteed item, the name, address, and telephone number shall be shown on the list for the subcontractor who installed equipment, equipment supplier or distributor, and equipment manufacturer. Completion date of the guarantee period shall correspond to the applicable specification requirements for each guaranteed item. The names of service representatives that will make warranty calls along with the day, night, weekend and holiday contacts for response to a call within the time period specified shall also be identified.

a. For Equipment in Place: The equipment list shall show unit retail value and nameplate data including model number, size, manufacturer, etc. This would include capital equipment and other nonexpendable supplies of a movable nature that are not affixed as an integral part of the facility and may be removed without destroying or reducing the usefulness of the

facility. Some examples are spare parts, special tools, manufacturing equipment, maintenance equipment, instruments, installed under this contract.

b. For Installed Building Equipment: The equipment list shall show unit retail value and nameplate data including model number, size, manufacturer, etc. This would include items of equipment and furnishings (including material for installation thereof), which are required to make the facility usable and are affixed as a permanent part of the structure. Some examples are plumbing fixtures, laboratory counters and cabinets, kitchen equipment, mechanical equipment, electrical equipment, and fire protection systems installed under this contract.

## 1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-11 Closeout Submittals

Equipment Warranty Booklet

## 1.4 EQUIPMENT WARRANTY IDENTIFICATIONS TAGS

### 1.4.1 GENERAL REQUIREMENTS

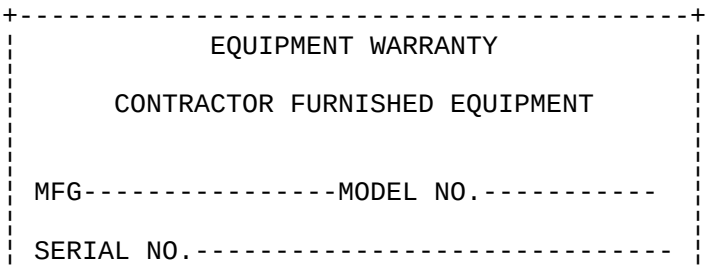
The Contractor shall provide warranty identification tags on all Contractor and government furnished equipment which is Contractor installed.

#### 1.4.1.1 Tags and Information

The tags and information shall be similar in format and size to the exhibits provided by this specification, and shall be suitable for interior and exterior locations, resistant to solvents, abrasion, and to fading caused by sunlight, precipitation, etc. These tags shall have a permanent pressure- sensitive adhesive back, and shall be installed in a position that is easily (or most easily) noticeable. If the equipment surface is not suitable for adhesive back, Contractor shall submit his alternative to the Contracting Officer's Authorized Representative for review and approval. Contractor furnished equipment that has differing warranties on its components will have each component tagged.

#### 1.4.1.2 Tags for Warranted Equipment

The tag for his equipment shall be similar to the following:



```
+-------------------------------------------+
|                                           |
| CONTRACT NO.------------------------------ |
|                                           |
| CONTRACTOR NAME--------------------------- |
|                                           |
| CONTRACTOR ADDRESS------------------------ |
|                                           |
| CONTRACTOR TELEPHONE--------------------- |
|                                           |
| CONTRACTOR WARRANTY EXPIRES-------------- |
|                                           |
| IN CASE OF WARRANTY ACTION FIRST CONTACT  |
|                                           |
|     [DEH] [BCE] AT [TELEPHONE NUMBER]     |
|                                           |
+-------------------------------------------+
```

```
+-------------------------------------------------+
|                                                 |
|                EQUIPMENT WARRANTY               |
|                                                 |
|          GOVERNMENT FURNISHED EQUIPMENT         |
|                                                 |
|  MFG _________________  MODEL NO._____________  |
|                                                 |
|  SERIAL NO. ____________________________________ |
|                                                 |
|  CONTRACT NO. __________________________________ |
|                                                 |
|  DATE EQUIP PLACED IN SERVICE _________________ |
|                                                 |
+-------------------------------------------------+
```

1.4.1.3 Exclusion to Providing Tags

If the manufacturer's name (MFG), model number and serial number are on the manufacturer's equipment data plate and this data plate is easily found and fully legible, this information need not be duplicated on the equipment warranty tag. The Contractor's warranty expiration date and the final manufacturer's warranty expiration date will be determined as specified by the Paragraph "WARRANTY OF CONSTRUCTION".

1.4.2 EXECUTION

The Contractor will complete the required information on each tag and install these tags on the equipment by the time of and as a condition of final acceptance of the equipment. The Contractor shall be responsible for scheduling acceptance inspection with the Contracting Officer (verbal and written notification required). If this inspection is delayed by the Contractor, the Contractor shall, at his own expense, update the in-service and warranty expiration dates on these tags.

1.4.3 Equipment Warranty Tag Replacement

Under the terms of this contract, the Contractor's warranty with respect to work repaired or replaced shall run for one year from the date of repair or replacement. Such activity shall include a data warranty identification tag on the repaired or replaced equipment. The tag shall

be furnished and installed by the Contractor, and shall be similar to the original tag, except that it should include the scope of repair and that the contractor's warranty expiration date will be one year from the date of acceptance of the repair or replacement. In the case of repair, the repair only will be covered by the extended warranty. In the case of replacement of a component, the component only will be covered by the extended warranty. In these cases, the original tags will not be removed, but an additional tag will be installed for the repair or component replacement.

SECTION 01 78 39.00 24

AS-BUILT DRAWINGS
07/20

PART 1 GENERAL

Attachments:

Modifications and Title Block Examples

1.1 DEFINITIONS

The definitions listed below form a part of this specification.

1.1.1 Red-Line Drawings

Contract drawings marked-up during construction to show actual work performed to include necessary sketches, modification drawings, shop drawings and notes.

1.1.2 As-Built Drawings

Electronic CAD files developed from the contract drawings that include all of the information from the redline drawings and suitable for half-size reproduction. Building Information Modeling (BIM) files are considered a part of As-Built Drawings.

1.1.3 Black-Line Drawings

Paper drawings reproduced from electronic CAD files or high quality reproducible drawings.

1.1.4 Full-Size Drawings

22 inches x 34 inches nominal size drawings with all details visually readable so that half-size plot will fit on 11 inches x 17 inches cut sheets.

1.1.5 Modification Circle

A circle with a horizontal line through the center to identify modification changes on the drawings. The top half will contain the letter "R" with the bottom half containing the Modification number, unless directed otherwise. The lettering standard will be 1/8-inch Arial.ttf.

1.1.6 Electronic CAD Files

Reference section 01 33 39.00 10 ADVANCED MODELLING (BIM/CIM/GIS/CAD) REQUIREMENTS for format of electronic CAD files.

1.1.7 Building Information Modeling (BIM) Files

Electronic files that model the project design as a 3D graphics that produce accurate construction documents as detailed in the available BIM Model.

### 1.1.8 Geodetic Datum

The geodetic datum is a set of constants specifying the coordinate system used for geodetic control for calculating coordinates of points on the earth. The horizontal control datum is North American Datum of 1983 (NAD 83) based on a geocentric origin and the Geodetic Reference System of 1980. The vertical control datum is the North American Vertical Datum of 1988.

### 1.1.9 State Plane Coordinate System (SPCS)

This project is based upon the Colorado Plane Coordinate System of 83 Colorado Central using a Lambert Conformal Conic projection. The SPCS is used so that a Cartesian coordinate system can be used in lieu of a spherical coordinate system. Use the meridians and base lines as well as the origin coordinates based on the Colorado surveying standards.

## 1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

50 Percent Preliminary As-Built Drawings; G-DO

100 Percent Preliminary As-Built Drawings; G-DO

Sustainability Documentation; G-RO

## 1.4 GENERAL REQUIREMENTS

### 1.4.1 As-built Drawings

Upon award of this contract, the Government will provide the Contractor PDFs of the Contract drawings. Once the contractor makes hardcopy distribution of these drawings in accordance with specification section 01 30 00.24 OTHER ADMINISTRATIVE AND SPECIAL REQUIREMENTS, the Government will provide the Contractor the Electronic CADD Files (Revit (.rvt) file for Building Drawings and Bentley (.dgn) and Bentley In-Roads Model for Site Drawings. The building BIM model will be provided at a level of detail (LOD) 300 with sufficient detail to facilitate design and schedules.

The Contractor shall create electronic CAD files in accordance with section 01 33 39.00 10 ADVANCED MODELLING (BIM/CIM/GIS/CAD) REQUIREMENTS, BIM Revit (.rvt) files for Building drawings, and full-size Red-Line Drawings showing As-Built conditions. Provide as-built Building BIM model in compliance with USACE Minimum Modeling Matrix (M3) for Level of Detail (LOD) and element Grade for "Record Models". Use the M3 Template located at https://cadbimcenter.erdc.dren.mil/. See Section 01 33 39.00 10 ADVANCED MODELING (BIM/CIM/GIS/CAD) REQUIREMENTS for additional requirements.. This project utilizes the ERDC/ITL TR-12-6 USACE A/E/C CAD Standard which are to be used on the As-Built drawings. The Contractor shall be responsible for obtaining the A/E/CStandards in effect at time of Contract award. The A/E/C Standards are available at:

https://cadbimcenter.erdc.dren.mil/

(New users will be required to register. See "New User Registration" at the website indicated above.)

The Contractor shall be responsible for obtaining the required CAD software and BIM software for their own use. **The Contractor shall not convert electronic drawing files from one software language to another.** The transmittal requirements for the As-built Drawings shall be shown as activities on the Contractor prepared project schedule.

All changes from the contract drawings shall be shown on the as-builts. All changes shall be accurately and neatly recorded on the As-built drawings using the same symbols, terminology, and general quality as the original set of contract drawings. All changes shall be shown on all drawings that are affected by the change. Changes include: actual work performed, deviations resulting from Government responses to Requests for Information or Serial letters, surveys, shop drawings, descriptive changes, sketch changes, and modifications to the contract. Systems designed or enhanced by the Contractor such as HVAC control system, fire alarm system fire sprinkler system, and irrigation sprinkler system, shall shown on the As-built drawings. Where contract drawings or specifications allow for options, only the option selected and actually constructed shall be shown on the As-Built Drawings.

### 1.4.2 Red-Line Drawings

Red-Line Drawings shall be updated throughout the construction phase of a contract showing all changes that will be shown on the final as-builts. All as-built conditions shall be on the Red-Line Drawings **within two (2) days** after the work activity is completed or shall be entered on the deficiency tracking system (see Section 01 45 00.00 10, QUALITY CONTROL). If the red-line drawings are not being updated, incomplete, or inaccurate, the Contractor shall be considered to not be making satisfactory progress and funds will be withheld from the progress payments.

The Contractor shall do red-line drawings in an electronic format.

#### 1.4.2.1 Electronic Red-lines

The Contractor shall make electronic drawings available to the COR at all times through a Local Area Network (LAN) or Internet connection. The connection shall have a download transfer rate not less than 10 Megabit/second (~1.250 Megabytes/second) and an upload transfer rate of not less than 1 Megabit/second (~124 kilobytes/second) in order to facilitate the timely access of drawing files. The Contractor shall make

backups of all the electronic drawings at the close of business on the final day of work each week on a durable digital media such as removable hard-drive, tape drive, or optical disk. Each weekly file system backup shall be preserved over the course of the project and not overwritten; with file folders or individual media labeled with the date of backup. The weekly backup media shall be stored in a fireproof and waterproof safe in a locked room of the Contractor's trailer. The Contractor must also provide the COR with a DVD containing updated PDF drawings on a monthly basis. All changes to the electronic drawings shall be shown with clouding and in accordance with ERDC/ITL TR-12-6.

### 1.4.3 GeoDataBase

The Contractor shall provide a DVD containing a SDSFIE/FGDC GeoReferenced personal GeoDataBase, in accordance with the requirements of this section and EM 1110-1-2909, unless otherwise directed by the Contracting Officer.

For all information outside of the building walls, such as contour lines, utility locations, and the actual building location, the Contractor shall provide a personal GeoDatabase in .mdb format using the latest version of Spatial Data Standards for Facilities, Infrastructure, and Environment (SDSFIE) as the database structure. Provide a shell database which will define the projection and database structure. The layering standards to be used are the SDSFIE standards. Typically, the development of this database is created with ESRI software, although there is other software that can be used. For all drawings within and including the exterior walls, the Contractor shall provide electronic drawings in accordance with section 01 33 39.00 10 ADVANCED MODELLING (BIM/CIM/GIS/CAD) REQUIREMENTS.

In addition, a short read-me file (Word format) shall be added to the DVD explaining the deliverable. This read-me file should include a description of the software used to create the data, projection, and include the attribute tables used.

### 1.4.4 Sustainability Documentation

See Section 01 33 29 SUSTAINABILITY REPORTING for detailed requirements. All Sustainability documentation shall be submitted within days after the final inspection. The Sustainability documentation shall be placed on two DVDs with one copy sent to the COR and one copy sent to the Omaha District Office (ATTN: Michael Hebert, CENWO-CDS-T).

## 1.5 PAYMENT

In accordance with the clause "Payment Under Fixed - Price Construction Contracts", cost load closeout activities amounts in accordance with Section 01 32 01.00 10 PROJECT SCHEDULE will be withheld from payment for the creation of As-Built Drawings until Final As-Built Drawings and GeoDatabase Files are delivered to and accepted by the COR.

## 1.6 CONTRACTOR PERFORMANCE RATING

The Government will evaluate the Contractor's performance in CPARS (Contractor Performance Assessment Reporting System) at intervals of no more than 365 days during the period of performance and complete the final evaluation within 120 days of completion of the project. The timeliness and quality of As-Built drawings submittals, Final As-built Drawings, Red-line drawings, Sustainability Documentation, and GeoDataBase Files will be an important factor in determining the assigned rating for the

Schedule evaluation area. If the Contractor fails to submit complete and accurate Final As-Built Drawings and GeoDataBase Files within sixty (60) calendar days of turning the completed project over to the Using Service, this failure will be noted in the comments under the Schedule evaluation area and may result in a lower rating for this area. Repeated failure to submit correct and accurate As-Built drawings submittals, Final As-built Drawings, Red-line drawings, Sustainability Documentation, and GeoDataBase Files may also result in lower ratings for the Quality and Management evaluation areas. The Contractor shall receive an Unsatisfactory rating for Sustainability documentation if Sustainability documentation is not submitted within 120 days after the final inspection.

## 1.7 TRANSMITTAL OF AS-BUILT DRAWINGS

### 1.7.1 Optional As-built Drawings Sample

The Contractor has the option to submit a sample of preliminary as-built drawings to the Omaha District Office that will be reviewed for formatting purposes. This submittal shall include five (5) distinct sheets from the project set of drawings. This optional submittal shall be sent to the Omaha District Office (ATTN: Michael Hebert, CENWO-CDS-T) and contain the following:

1. One (1) DVD containing the following for each sheet:
    a. Electronic CAD Files
    b. Individual full-size PDF Drawings
    c. One (1) Combined Set of full-size PDF Drawings with bookmarks for each sheet

### 1.7.2 50 Percent Preliminary As-Built Drawings

The 50 Percent Preliminary As-Built Drawings are to be submitted within ten (10) days after 50% physical completion unless otherwise directed by the COR. These drawings will be reviewed by the government for technical content and formatting requirements. The Electronic CAD Files shall include all changes up to the time 50 Percent Preliminary As-Built Drawings are furnished with "clouding" around the changes. All drawings contained in the complete project set of drawings plus any additional drawings shall be submitted with the 50 Percent Preliminary As-Built Drawings. The 50 Percent Preliminary As-Built Drawings shall be submitted within ten days after unless otherwise directed by the COR. 50 Percent Preliminary As-Built Drawings shall include the following:

1. One (1) DVD to the Omaha District Office (ATTN: Michael Hebert, CENWO-CDS-T) containing the following:
    a. Electronic CAD Files
    b. Individual full-size PDF Drawings
    c. Combined Set of full-size PDF Drawings with bookmarks for each sheet
2. One set of half-size black-line drawings to the COR

If a resubmittal is required, the contractor shall resubmit within fifteen days after receiving comments back from the government. If the contractor fails to submit the 50 Percent Preliminary As-Built Drawings by the specified time, the contractor shall be considered to not be making satisfactory progress on the project and funds will be withheld from the progress payments.

### 1.7.3 100 Percent Preliminary As-Built Drawings

The 100 Percent Preliminary As-Built Drawings include all changes to the drawings as specified. The 100 Percent Preliminary As-Built Drawings will be reviewed for technical content and formatting requirements. Within thirty (30) days after the final inspection, the Contractor shall submit 100 Percent Preliminary As-Built Drawings indicating all as-built changes with "clouding" on all of the project drawings. All drawings contained in the complete project set of drawings plus any additional drawings shall be submitted with the 100 Percent Preliminary As-Built Drawings. The COR may grant the Contractor additional time if the Contractor is making reasonable progress on the as-builts, in the sole judgment of the COR. The Contractor shall not submit the Final As-Built Drawings until the 100 Percent Preliminary As-Built Drawings are approved. 100 Percent Preliminary As-Built Drawings shall include the following:

1. One (1) DVD to the Omaha District Office (ATTN: Michael Hebert, CENWO-CDS-T) containing the following:
    a. Electronic CAD Files
    b. Individual full-size PDF Drawings
    c. Combined Set of full-size PDF Drawings with bookmarks for each sheet
2. One (1) set of full-size black-line drawings to the COR
3. One (1) set of Red-line drawings to the COR for reviewing purposes (hardcopy option).

### 1.7.4 Final As-Built Drawings

The Contractor shall produce Final As-Built Drawings without "clouding". The Final As-Built Drawings shall include all changes shown on the 100 Percent Preliminary As-Built Drawings including any additional required changes. All drawings contained in the complete project set of drawings plus any additional drawings shall be submitted with the Final As-Built Drawings. The Final Drawings shall be submitted no later than ten days after the 100 Percent Preliminary As-Built Drawing submittal is approved. The COR may grant the Contractor additional time if the Contractor is making reasonable progress on the as-builts. The Contractor shall send the following documents to the COR:

1. Three DVDs containing the following:
    a. Electronic CAD Files
    b. Individual full-size PDF Drawings
    c. Combined Set of full-size PDF Drawings with bookmarks for each sheet
    d. GeoDatabase Files

The Contractor shall also send the following to the Omaha District Office (ATTN: Michael Hebert, CENWO-CDS-T):

1. One DVD containing the following:
    a. Electronic CAD Files
    b. Individual full-size PDF Drawings
    c. Combined Set of full-size PDF Drawings with bookmarks for each sheet
    d. GeoDatabase Files
2. One half-size set of black-line drawings.

All GeoDatabase files shall be under a folder titled "GeoDatabase".

## 1.8 AS-BUILT DRAWINGS FORMAT REQUIREMENTS

### 1.8.1 General Formatting

Preparation of As-built Drawings shall be in accordance with ERDC/ITL TR-12-6 requirements and/or match the detail shown on the contract drawings. The drawings shall include all of the requirements below:

a. The drawing index shall be updated when drawings are added.
b. When opened, the view shall be zoomed to fit the border.
c. All files shall reference a border supplied by the CAD/BIM Technology Center (https://cadbimcenter.erdc.dren.mil/) placed in the layout/sheet model at a scale of 1 at the location (0,0).
d. All unnecessary information outside the border shall be deleted.
e. All files shall be purged/compressed.
f. All reference files shall be included and shall be 'Bound' (AutoCAD) or 'Attached' (Microstation) to the CADD files in which the files are referenced.
g. All text shall use the Arial.ttf font.
h. An ASCII text file shall be provided with the following information: the name and phone number of the person we need to contact if we have problems, and the version of the CAD software used to create and/or work on the drawings.
i. Pen tables for plotting shall be supplied.
j. Each sheet/design shall have its own file and file name with only one layout/sheet per design file.
k. Half toning shall be accomplished by using the color 8 and setting the pen table to plot color 8 to half tone.
l. The file name shall be the project code followed by the sheet identification number. The file name shall be included in the border on every sheet and shall match the name of the file on the DVD. The project code is FCDC.
m. The File number shall be included in the border on every sheet. Contact CENWO.ConstructionSubmittal@usace.army.mil for file number.
n. The cover sheet will have "Contract Award Set" changed to "As-Built Record Set" with month & year completed.
o. All preliminary as-builts and redlines shall show drawing changes by "clouding" the affected area in layer G-ANNO-REVS in the drawing file.
p. All submitted Electronic CAD Files and PDF drawings shall be under a folder labeled "As-Built" on the submitted DVD.
q. Both the DVD case and DVD shall contain the name of the project, location, project code, solicitation number, contract number, and words detailing which submittal it is. The Final As-builts Drawings should be titled "As-Built Record Set".
r. Do not use zipped or compressed folders on any of the As-built submittals.
s. On the cover sheet add or revise text to read "This folio includes all reissued and descriptive amendments, RFIs, and modifications."
t. The Electronic CAD files and PDF drawings shall be in separate folders on each DVD.

### 1.8.2 Title Block

All information in the title block shall be filled in and correct. The title block shall also include all of the requirements below.

a. "RECORD DRAWING" text shall be added below the title block on the right side of the drawing on all sheets.

b. The date to be added in the revision box for modifications is found in Block 3 of Form SF-30.
c. The top line of the revision box shall state "REVISED TO SHOW AS-BUILT CONDITIONS" and dated. Use a "-" for the "Mark".
d. The date box shall have the month and year as-builts were completed.
f. The approved box shall have the initials MH.
e. The contract number and the solicitation number (if available) shall be shown on all sheets.
f. Additional word abbreviations, not found on the abbreviation sheet but necessary to describe the work, shall be properly identified and incorporated with the other standard word abbreviations.
g. Modifications should be properly noted in the title block in accordance with paragraph "Modification Changes" below.

1.8.3 Modification Changes

All modification changes shall be included on the as-built drawings. Modification changes at a minimum shall include all revised and reissued sheets, descriptive changes, sketches, etc. Any modification change that also affects other sheets other than the one referenced with the modification shall also be changed as appropriate. Typically, modification changes can be done by following the descriptive change included with the modification, but may require additional effort depending on the change and level of detail of the modification change. Modifications shall be posted in accordance with the following.

a. Follow directions in the modification for posting all changes.
b. All modifications to the contract shall be posted in chronological order.
c. The last modification number completed on the sheet should be shown with the modification circle in the top right corner of the "Project Title" and "Project Location" box.
d. All modifications to all plans, sections, or details, shall have a modification number placed in the revision box over column entitled "Mark". The statement "GENERAL REVISIONS" may be used when applicable.
e. The Modification Circle size shall be 1/2-inch diameter unless the area where circle is to be placed is crowded. Use smaller size circle for crowded areas.
f. A Modification Circle shall be place at the location of each deletion.
g. For all new details or sections that are added to a drawing, place a Modification Circle by the detail or section title.
h. For changes to a drawing, place a Modification Circle by the title of the affected plan, section or detail titles (each location).
i. For changes to schedules on drawings, a Modification Circle shall be placed either by the schedule heading or by the change in the schedule.

1.8.4 Legends

Symbols, which conflict with those on the original contract legend sheet, shall not be used. Additional symbols, necessary to depict any additional work items, shall be properly identified and added to the legend sheet or supplemental legend. Those projects that do not have legend sheets may use supplemental legends on each sheet where symbol is shown.

PART 2 PRODUCTS (NOT APPLICABLE)

PART 3 EXECUTION

3.1 GENERAL

The Contractor shall make revisions to, and maintain, the red-line and as-built drawings to the same level of detail as shown on the original Contract drawings. The Contractor shall provide any additional full-size drawings as required to display all details. In addition, the GeoDatabase Files shall be prepared as specified above and submitted in conjunction with the As-Built drawings.

3.2 SITE WORK

3.2.1 Utilities

The as-built drawings shall show all utilities whether active or abandoned, and will include all those shown on the original contract drawings or found on-site. The type of utility, location, general direction, size, material make-up and depth shall be shown. The location and description of any utility line or other installations of any kind known to exist within the construction area shall be shown. The location shall include dimensions to permanent features. All new underground utility lines (including electrical power and communications, gas, water, sanitary sewer, storm drains, roof drains and culverts) shall be located during installation. The Contractor shall survey pipe invert of gas, water, sanitary sewer, storm drains, roof drains and culverts and top of duct bank of electrical power and communications lines and associated fixtures (valves, manholes, test points, meters, cathodic protection points, tanks, ground points, and all point features along the new utility lines). Storm drains and sanitary sewer lines shall be surveyed where pipes enter manholes and inlets and at 100-foot maximum intervals along the line. The inverts of all cleanouts and tees shall be surveyed. Inverts at each end of culverts shall be surveyed. Electrical power, communications, gas and water lines shall be surveyed at all manholes, tees, valves, corners, changes in direction and at intervals along the line which will accurately depict the location of the line in both horizontal and vertical directions (50-foot maximum interval). The horizontal and vertical accuracy shall be that 100% of the points are + 0.25' of their absolute position. New underground utility lines shall be shown as 3-dimensional elements in a Bentley.dgn file.

3.2.2 Structures

Structures above and below ground shall be shown. The size, material make-up, location, height, and/or depth shall be shown. Manholes shall show rim elevation and invert elevations as applicable. Power poles shall show electrical equipment, guy wires, and voltage rating.

3.2.3 Grades

Grade or alignment of roads, structures, or utilities shall be corrected if any changes were made from the contract drawings. Elevations shall be corrected if changes were made in site grading. If any grades are finalized outside of the respective grades tolerances, that new grade shall be shown on the as-builts.

## 3.3 STRUCTURAL

### 3.3.1 Steel/Concrete

Shop drawings that deviate from the contract drawings shall be incorporated in the As-Built Drawings.

## 3.4 MECHANICAL

### 3.4.1 Ductwork

Ductwork shall be shown to reflect actual installation and duct size. Ductwork routing changes shall be shown.

### 3.4.2 Plumbing

Piping and fixtures shall be shown to reflect the type of material, size and the route or location.

## 3.5 ELECTRICAL

### 3.5.1 PANELS

All contract drawing panel schedules shall be revised to show as-built conditions. Home-run circuit designation on electrical drawings shall accurately correspond to the as-built panel schedules.

### 3.5.2 Controls

All control diagrams in contract drawings shall be revised to reflect as-built conditions, and setpoints.

## 3.6 CONTRACTOR SHOP DRAWINGS

Contractor shop drawings, which supersede data on the contract plans and/or additional drawings, prepared by the Contractor, shall be incorporated into the As-Built Drawings. Design plans prepared by the Contractor shall include the designer's name on the As-Built Drawings.

SECTION 01 91 00.15

TOTAL BUILDING COMMISSIONING
**05/16**

PART 1 GENERAL

1.1 SUMMARY

Commission the building systems listed herein. Employ the services of an independent Commissioning Firm. The Commissioning Firm must be a 1st tier subcontractor of the General or Prime Contractor and must be financially and corporately independent of all other subcontractors. The Commissioning Firm must employ a Lead Commissioning Specialist that coordinates all aspects of the commissioning process, including support for cybersecurity controls implementation. Refer to specification section(s) 25 05 11 CYBERSECURITY FOR FACILITY-RELATED CONTROL SYSTEMS. The Commissioning Agent will ensure that all commissioned systems are fully functioning per design intent after implementation of cybersecurity controls. Conform to the commissioning procedures outlined in this specification.

1.2 SYSTEMS TO BE COMMISSIONED

Commission the following systems:

Heating, Ventilating, Air Conditioning, and Refrigeration Systems (HVAC)
Building Automation System
Lighting Systems
Power Distribution Systems
Service Water Heating Systems
Plumbing Systems
Natural Gas Systems
Water Pumping and Mixing Systems
Energy and Water Utility Metering Systems and Sub-Meters
Four Fold Door system, operators and safety equipment
All Facility Related Control Systems (FRCS) including but not limited to those which have been identified above
Building Envelope: moisture and thermal integrity and air tightness

1.3 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

## 1.4 COMMUNICATION WITH THE GOVERNMENT

The Lead Commissioning Specialist (CxC) must submit all plans, schedules, reports, and documentation directly to the Contracting Officer Representative concurrent with submission to the CQC System Manager. The Lead Commissioning Specialist must have direct communication with the Contracting Officer's Representative regarding all elements of the commissioning process.

## 1.5 SEQUENCING AND SCHEDULING

### 1.5.1 Sequencing

Complete the following prior to starting Functional Performance Tests of mechanical systems:

a. All equipment and systems have been completed, cleaned, flushed, disinfected, calibrated, tested, and operate in accordance with contract documents and construction plans and specifications.

b. Performance Verification Tests of the controls systems have been completed and the Performance Verification Test Report has been submitted and approved in accordance with Specification Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC .

c. Testing, Adjusting, and Balancing has been completed and the Testing, Adjusting, and Balancing Report, has been submitted and approved in accordance with Specification Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC.

d. The building envelope is enclosed according to contract documents with final construction completed.

e. The Pre-Functional Checklists have been submitted and approved.

f. The Certificate of Readiness for mechanical systems has been submitted and approved.

Complete the following prior to starting Functional Performance Tests of the electrical systems:

a. All electrical, power generation, and lighting equipment and systems

have been completed, calibrated, tested, and operate in accordance with contract documents and construction plans and specifications.

b. The building envelope is enclosed according to contract documents with final construction completed.

c. Ceiling tiles, floor coverings, and window coverings are in place.

d. The Certificate of Readiness for electrical systems has been submitted and approved.

1.5.2 Project Schedule

Include the following tasks in the project schedule required by Section 01 32 01.00 10 PROJECT SCHEDULE. Ensure sufficient time is scheduled to accommodate the requirements of this specification section. The order of items listed below is not intended to imply a specified sequence:

a. Submission and approval of the Commissioning Specialist

b. Submission and approval of the Testing, Adjusting, and Balancing (TAB) Firm and TAB Specialist specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

c. Submission of the Design Review Report specified herein.

d. Submission of the Design Review Report specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC.

e. Submission and approval of the Construction Phase Commissioning Plan

f. Installation of permanent utilities (gas, water, electric)

g. Building Envelope Construction

h. Submission and approval of the Building Envelope Inspection Checklists

j. Drainage and Vent, Building Sewers, Water Supply Systems and Backflow Prevention Assembly Tests specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE

k. Factory Acceptance Testing for each of the systems to be commissioned as required by technical specifications

l. Manufacturer's Equipment Start-Up for each of the systems to be commissioned.

m. Potable Water System Flushing specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE

n. Operational Tests of the plumbing system specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE.

o. Potable Water System Disinfection specified in Section 22 00 00 PLUMBING, GENERAL PURPOSE

p. Submission and approval of the TAB Schematic Drawings, Report Forms, and Procedures specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC.

q. Submission and approval of Duct Air Leakage Test Procedures specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

r. Duct Air Leakage Test Execution specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

s. Submission and approval of the Final Duct Air Leakage Test Report specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

t. Testing, Adjusting, and Balancing (TAB) Field Work required by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

u. Submission and approval of the TAB Report specified in Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

v. TAB Field Acceptance Testing required by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC

w. Submission and approval of the Start-Up Testing Report specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

x. Submission and approval of the Performance Verification Test Procedures specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC.

y. Performance Verification Tests required by Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC

z. Performance Verification Test Report specified in Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC

aa. Pre-Functional Checklist Submittal

bb. Functional Performance Testing for each system to be commissioned

cc. Integrated Systems Tests

dd. Post-Test Deficiency Correction for each system to be commissioned

ee. Re-Testing

ff. Training for each of the systems to be commissioned

gg. Systems Manual, Maintenance Plan, and Service Life Plan submission and approval

## 1.6 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Lead Commissioning Specialist; G, DO

Technical Commissioning Specialists; G, DO

SD-06 Test Reports

Design Review Report; G, DO

Interim Construction Phase Commissioning Plan; G, DO

Final Construction Phase Commissioning Plan; G, DO

Template Building Envelope Inspection Checklists; G, DO

Building Envelope Inspection Checklists; G, DO

Pre-Functional Checklists; G, DO

Issues Log

Commissioning Report; G, DO

Post-Construction Trend Log Report; G, DO

SD-07 Certificates

Certificate of Readiness; G, DO

SD-10 Operation and Maintenance Data

Training Plan; G, RO

Training Attendance Rosters; G, RO

Systems Manual; G, RO

Maintenance and Service Life Plans; G, DO

SD-11 Closeout Submittals

Construction Phase Commissioning Plan; G, DO

Final Commissioning Report; G, DO

## 1.7 COMISSIONING SPECALISTS

### 1.7.1 Lead Commissioning Specialist

The Contractor must provide a Lead Commissioning Specialist (CxC) that has a minimum of five years of commissioning experience, including two projects of similar size and complexity, and that is one of the following: a NEBB qualified Systems Commissioning Administrator (SCA); ACG Certified Commissioning Authority (CxA); ICB/TABB Certified Commissioning Supervisor; BCA Certified Commissioning Professional (CCP); AEE Certified Building Commissioning Professional (CBCP); University of Wisconsin-Madison Qualified Commissioning Process Provider (QCxP); ASHRAE Commissioning Process Management Professional (CPMP).

a. Submit the Lead Commissioning Specialist's certification of qualifications including the name of the specialist and firm; certifications; years of experience; and a listing of representative projects of similar size and complexity no later than 30 calendar days after Notice to Proceed. Submit one hard copy and an electronic copy.

b. The Lead Commissioning Specialists certifications must be maintained for the entire duration of the duties specified herein. If, for any reason, the specialist loses a certification during this period, immediately notify the Contracting Officer's Representative and submit another Lead Commissioning Specialist for approval. All work specified in this specification section to be performed by the Lead Commissioning Specialist is invalid if the Lead Commissioning Specialist loses its certification prior to contract completion and must be performed by an approved successor.

c. The Lead Commissioning Specialist must lead and oversee the commissioning work specified herein and be the primary point of contact for the Government regarding the commissioning work.

1.7.2 Technical Commissioning Specialists

Technical Commissioning Specialists, provided by the Contractor and that have the following qualifications, must perform the technical work specified herein associated with each system to be commissioned:

a. The technical work associated with mechanical systems including Heating, Ventilating, Air Conditioning, and Refrigeration Systems; Building Automation System; Utility Monitoring and Control System; Service Water Heating Systems; Plumbing Systems; Water Pumping and Mixing Systems; Energy and Water Utility Metering Systems must be performed by a Commissioning Specialist certified by NEBB, ACG, ICB/TABB, or BCA in the commissioning of HVAC systems with five years of experience in the commissioning of HVAC systems.

b. The technical work associated with electrical systems including Lighting Systems; Power Distribution Systems; Power Generation Systems; must be performed by an engineering technician certified by the InterNational Electrical Testing Association (NETA) or the National Institute for Certification in Engineering Technologies (NICET) with five years of experience inspecting, testing, and calibrating electrical distribution and generation equipment, systems, and devices.

c. The technical work associated with the Building Envelope system must be performed by a registered architect with five years of building envelope design or construction experience. The Contractor's team member with the required experience related to the building envelope may act as the Air Barrier Inspector required by specification section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM provided that all qualification requirements of that specification section are met.

d. Submit the Technical Commissioning Specialist's certification of qualifications including the name of the specialist and firm; certifications; years of experience; and a listing of representative projects of similar size and complexity no later than 30 calendar days after Notice to Proceed. Submit one hard copy and an electronic copy.

### 1.7.3 Commissioning Standard

Comply with the requirements of the commissioning standard under which the Commissioning Specialists qualifications are approved. When the firm and specialists are certified by BCA, AEE, ASHRAE, or the University of Wisconsin-Madison, comply with the requirements of one of the acceptable standards unless otherwise stated herein. The acceptable standards are ACG Commissioning Guideline, NEBB Commissioning Standard, SMACNA 1429, or ASHRAE 202. Comply with applicable NETA and NICET testing standards for electrical systems.

a. Implement all recommendations and suggested practices contained in the Commissioning Standard and electrical test standards.

b. Use the Commissioning Standard for all aspects of Commissioning, including calibration of instruments.

c. Where the instrument manufacturer calibration recommendations are more stringent than those listed in the Commissioning Standard, adhere to the manufacturer calibration recommendations.

d. All quality assurance provisions of the Commissioning Standard such as performance guarantees are part of this contract.

e. The Commissioning Specialists must develop commissioning procedures for any systems or system components not covered in the Commissioning Standard.

f. Use any new requirements, recommendations, and procedures published or adopted prior to contract solicitation by the body responsible for the Commissioning Standard.

## 1.8 SUSTAINABILITY THIRD PARTY CERTIFICATION (TPC)

The Commissioning Specialists must execute and document the commissioning activities required of the Commissioning Authority for the purposes of complying with the Third Party Certification (TPC) requirements for the project in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Provide all commissioning documentation required to meet the TPC requirements.

## 1.9 ISSUES LOG

The Lead Commissioning Specialist must develop and maintain an Issues Log for tracking and resolution of all deficiencies discovered through commissioning review, inspection, and testing. Include the date of final resolution of issues as confirmed by the Commissioning Specialist. Submit the Issues Log on a monthly basis at a minimum. At any point during construction, any commissioning team member finding deficiencies may communicate those deficiencies in writing to the Commissioning Specialist for inclusion into the Issues Log.

Track construction deficiencies identified in the Issues Log using RMS CM as specified in Specification Section 01 45 00.15 10 RESIDENT MANAGEMENT SYSTEM CONTRACTOR MODE(RMS CM).

## 1.10 CERTIFICATE OF READINESS

Prior to scheduling Functional Performance Tests for each system, issue a

Certificate of Readiness for the system certifying that the system is ready for Functional Performance Testing. The Certificate of Readiness must include, for each system to be commissioned, all equipment and system start-up reports; Performance Verification Test Reports; completed Building Envelope Inspection Checklists; completed Pre-Functional Checklists; Testing, Adjusting, and Balancing (TAB) Report; HVAC Controls Start-Up Reports to the extent applicable to the system. The Contractor; the Lead Commissioning Specialist; the Contractor's Quality Control Representative; the Mechanical, Electrical, Controls, and TAB subcontractor representatives must sign and date the Certificate of Readiness. Submit the Certificate of Readiness for each system no later than 14 calendar days prior to Functional Performance Tests of that system. Submit one hard copy and an electronic copy. Do not schedule Functional Performance Tests for a system until the Certificate of Readiness for that system receives approval by the Government.

## PART 2 PRODUCTS

Not used

## PART 3 EXECUTION

### 3.1 CONSTRUCTION PHASE

#### 3.1.1 Construction Commissioning Coordination Meeting

The Lead Commissioning Specialist must lead a Construction Commissioning Coordination Meeting no later than 14 days after approval of the Commissioning Firm and Commissioning Specialists to discuss the commissioning process including contract requirements, lines of communication, roles and responsibilities, schedules, documentation requirements, inspection and test procedures, and logistics as specified in this specification section. The Contractor's Superintendent or Project Manager, the Contractor's Quality Control Representative, and the Government must attend this meeting. Invite the User and a Directorate of Public Works Representative, to attend this meeting.

#### 3.1.2 Construction Phase Commissioning Plan

##### 3.1.2.1 Interim Construction Phase Commissioning Plan

The Lead Commissioning Specialist (CxC) must prepare the Interim Construction Phase Commissioning Plan. Submit the Interim Construction Phase Commissioning Plan to the Government for review and aproval no later than 30 calendar days after the Construction Commissioning Coordination Meeting and no later than 14 days prior to the start of construction of the building envelope. Submit one hard copy and an electronic copy.

Identify the commissioning and testing standards and outline the overall commissioning process, the commissioning schedule, the commissioning team members and responsibilities, lines of communication, documentation requirements for the construction phase of the project, and Template Building Envelope Inspection Checklists in the Interim Construction Phase Commissioning Plan.

###### 3.1.2.1.1 Checklists

Download example Building Envelope Inspection Checklists, Pre-Functional Checklists, Functional Performance Test Checklists, and Integrated Systems

Test Checklists for specification section 01 91 00.15 TOTAL BUILDING COMMISSIONING at the following location: http://www.wbdg.org/FFC/NAVGRAPH/graphtoc.pdf. The checklists submitted in the Interim and Final Construction Phase Commissioning Plans must contain the same level of detail shown in the examples. The submitted checklists are not required to match the format of the examples.

3.1.2.1.2 Template Building Envelope Inspection Checklists

The Building Envelope Technical Commissioning Specialist must develop the Template Building Envelope Inspection Checklists. Include items that verify the building materials and construction maintain the required thermal and moisture integrity and air tightness of the building envelope system in the Building Envelope Inspection Checklists.

3.1.2.2 Final Construction Phase Commissioning Plan

The Lead Commissioning Specialist (CxC) must prepare the Final Construction Phase Commissioning Plan. Submit the Final Construction Phase Commissioning Plan to the Government for review and approval no later than 30 calendar days prior to the start of Pre-Functional Checks. Submit one hard copy and an electronic copy.

Include the information provided in the Interim Construction Phase Commissioning Plan. In addition, the Technical Commissioning Specialist must develop the Pre-Functional Checklists, Integrated Systems Test Checklists, and Functional Performance Test Checklists for each building, for each system required to be commissioned, and for each component for inclusion in the Final Construction Phase Commissioning Plan.

3.1.2.2.1 Pre-Functional Checklists

The Pre-Functional Checklists must include items for physical inspection or testing that demonstrate that installation and start-up of equipment and systems is complete. See paragraph Pre-Functional Checks for more information. Functional Performance and Integrated Systems Test test procedures must explain, step-by-step, the actions and expected results that will demonstrate that the system performs in accordance with the contract in the Functional Performance Test and Integrated Systems Test Checklists. See paragraph Functional Performance and Integrated Systems Tests for more information.

3.1.2.2.2 Functional Performance Test Checklists

Functional Performance Test Checklists must include procedures that explain, step-by-step, the actions and expected results that will demonstrate that the system performs in accordance with the contract. See paragraph Functional Performance and Integrated Systems Tests for more information. Include the following sections and details appropriate to the systems being tested in the Functional Performance Test Checklists:

a. Notable system features including information about controls to facilitate understanding of system operation

b. Conclusions and recommendations. Conclusions must clearly indicate if system does or does not perform in accordance with contract requirements. Recommendation must clearly indicate that the system should or should not be accepted by the Government.

c. Test conditions including date, beginning and ending time, and beginning and ending outdoor air conditions

d. Attendees

e. Identification of the equipment involved in the test

f. Control system feature identification

g. Point-to-point observations including demonstrating system flow meters and sensors have been calibrated and are correctly displayed on the Operator work station

h. Actuator operation observations demonstrating actuator responses to commands from the control system

i. As-found condition of the system operation

j. List of test items with step numbers along with the corresponding feature or control operation, intended test procedure, expected system response, and pass/fail indication.

k. Space for comments for each test item.

3.1.2.2.3 Integrated Systems Test Checklists

Integrated Systems Test Checklists must include test procedures that explain, step-by-step, the actions and expected results that will demonstrate that the system performs in accordance with the contract. See paragraph Functional Performance and Integrated Systems Tests for more information. Include the following sections in the Integrated Systems Test Checklists:

a. Notable features of the interconnected systems organized by discipline including information to facilitate understanding of system operation

b. Conclusions and recommendations. Conclusions must clearly indicate if the systems do or do not perform in accordance with contract requirements. Recommendation must clearly indicate that the systems should or should not be accepted by the Government

c. Test conditions including date and beginning and ending time

d. Attendees

e. Identification of the equipment and systems involved in the test

f. List of test items with step numbers along with the corresponding feature or control operation, intended test procedure, expected system response, and pass/fail indication.

g. Space for comments for each test item.

3.1.3 Design Review

The Lead Commissioning Specialist and Technical Commissioning Specialists must review the construction contract plans and specifications, the Owner's Project Requirements, and the Basis of Design. The Owner's Project Requirements are attached as Appendix A. The Basis of Design is

attached as Appendix B. The Owner's Project Requirements and Basis of Design documents are not contract documents and are provided for commissioning review purposes only.

a. Advise the Contracting Officer's Representative of any discrepancies between the Basis of Design and Owner's Project Requirements, deficiencies of the design to comply with the Owner's Project Requirements or Basis of Design, and deficiencies that would prevent the building systems and features from operating or performing effectively and from being adequately maintainable.

b. The Commissioning Specialists must provide a Design Review Report individually listing each deficiency and the corresponding proposed corrective action necessary for proper system operation or performance. Submit one hard copy and an electronic copy of the report to the Contracting Officer's Representative no later than 14 days after approval of the Commissioning Specialists.

c. The Lead Commissioning Specialist must participate in a meeting to discuss any items contained in the report no later than 14 calendar days after submission of the report.

3.1.4 Construction Submittals

Provide all submittals associated with the systems to be commissioned, including shop drawings; equipment submittals; test plans, procedures, and reports; and resubmittal's to the Commissioning Specialists. The Technical Commissioning Specialist must review the submittals to the extent necessary verify that the equipment and system installation will comply with the contract requirements and the requirements of the Basis of Design and the Owner's Project Requirements.

3.1.5 Inspection and Testing

Demonstrate that all system components have been installed, that each control device and item of equipment operates, and that the systems operate and perform, including interactive operation between systems, in accordance with contract documents and the Owner's Project Requirements. Requirements in related specification sections are independent from the requirements of this section and do not satisfy any of the requirements specified in this specification section. Provide all materials, services, and labor required to perform the Pre-Functional Checks, Building Envelope Inspection, Integrated Systems Tests, and Functional Performance Tests.

3.1.5.1 Commissioning Team

Provide a commissioning representative for each sub-contractor associated with the systems to be commissioned. Each commissioning representative is responsible for coordination of their respective sub-contractor's execution of the commissioning activities and participation in the inspection and testing required by this specification section. Substitutes must be approved by the Contracting Officer's Representative.

3.1.5.1.1 Building Envelope Inspections Team

The following team members must participate in building envelope inspections:

| Designation | Function |
|---|---|
| CxB | Building Envelope Technical Commissioning Specialist |
| QAR | Contracting Officer's Quality Assurance Representative |
| CQC | Contractor's Quality Control Personnel |
| BEC | Contractor's Building Envelope Commissioning Representative |
| | |

3.1.5.1.2 Mechanical System Pre-Functional Checks Team

The following team members must participate in Pre-Functional checks of mechanical systems:

| Designation | Function |
|---|---|
| CxM | Mechanical System Technical Commissioning Specialist |
| QAR | Contracting Officer's Quality Assurance Representative |
| CQC | Contractor's Quality Control Personnel |
| MC | Contractor's Mechanical Commissioning Representative |
| EC | Contractor's Electrical Commissioning Representative |
| CC | Contractor's Controls Commissioning Representative |
| TABC | Contractor's TAB Commissioning Representative |
| PC | Contractor's Plumbing Commissioning Representative |
| | |

3.1.5.1.3 Electrical System Pre-Functional Checks Team

The following team members must participate in Pre-Functional checks of electrical systems:

| Designation | Function |
|---|---|
| CxE | Mechanical System Technical Commissioning Specialist |
| QAR | Contracting Officer's Quality Assurance Representative |
| CQC | Contractor's Quality Control Personnel |

| Designation | Function |
|---|---|
| EC | Contractor's Electrical Commissioning Representative |

3.1.5.1.4 Mechanical Systems Test Team

The following team members must participate in Functional Performance and Integrated Systems Testing of mechanical systems:

| Designation | Function |
|---|---|
| CxM | Mechanical System Technical Commissioning Specialist |
| QAR | Contracting Officer's Quality Assurance Representative |
| CQC | Contractor's Quality Control Personnel |
| MC | Contractor's Mechanical Commissioning Representative |
| EC | Contractor's Electrical Commissioning Representative |
| CC | Contractor's Controls Commissioning Representative |
| TABC | Contractor's TAB Commissioning Representative |
| PC | Contractor's Plumbing Commissioning Representative |
| | |
| | |
| | |
| | |

3.1.5.1.5 Electrical Systems Test Team

The following team members must participate in Functional Performance and Integrated Systems Testing of electrical systems:

| Designation | Function |
|---|---|
| CxE | Mechanical System Technical Commissioning Specialist |
| QAR | Contracting Officer's Quality Assurance Representative |
| CQC | Contractor's Quality Control Personnel |
| EC | Contractor's Electrical Commissioning Representative |

| Designation | Function |
|---|---|
| | |

3.1.5.1.6 Other Pre-Functioanl and Functional Performance Participants

The following may participate as team members during Pre-Functional Checks and Functional Performance Testing:

| Designation | Function |
|---|---|
| DPW | Directorate of Public Works Representative |
| | |
| | |
| | |
| User | Using Agent's Representative |

3.1.5.2 Building Envelope Inspection

Document building envelope inspection by the commissioning team using the approved Template Building Envelope Inspection Checklists. Indicate commissioning team member inspection and acceptance of each Building Envelope Inspection Checklist item by initials at the time they are inspected and found to be in conformance with contract requirements. Inspect checklist items before they become hidden as construction progresses.

a. Submit the completed and initialed Building Envelope Inspection Checklists no later than 7 calendar days after completion of inspection of all checklists items. Submit one hard copy and an electronic copy.

b. The Building Envelope Technical Commissioning Specialist must make at least two site visits to the site to observe construction of the building envelope in-progress. On each visit, the Building Envelope Commissioning Specialist must review the Contractor's in-progress checklists to ensure that the commissioning team is inspecting the building envelope as required.

3.1.5.3 Pre-Functional Checks

Pre-Functional Checklists from the approved Final Construction Phase Commissioning Plan must be completed by the commissioning team. Complete one Pre-Functional Checklist for each individual item of equipment or system for each system required to be commissioned including, but not limited to, ductwork, piping, equipment, fixtures (lighting and plumbing), and controls. Indicate commissioning team member inspection and acceptance of each Pre-Functional Checklist item by initials. Acceptance

of each Pre-Functional Checklist item by each team member indicates that item conforms to the construction contract requirements in their area of responsibility. Technical Commissioning Specialist acceptance of each Pre-Functional Checklist item indicates that each item has been installed correctly and in accordance with contract documents and the Owner's Project Requirements. Submit the completed and initialed Pre-Functional Checklists no later than 7 calendar days after completion of inspection of all checklists items for each system. Submit one hard copy and an electronic copy. Include manufacturer start-up checklists associated with equipment with the submission of the Pre-Functional Checklists.

3.1.5.4 Testing, Adjusting, and Balancing (TAB) Report and Field Acceptance Testing

The Mechanical System Technical Commissioning Specialist must review the pre-final TAB Report required by Specification Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC. Identify any deficiencies to the Contracting Officer's Representative and the Contractor's Quality Control Personnel. Resolve all deficiencies prior to TAB Field Acceptance Testing.

The Mechanical System Technical Commissioning Specialist must witness the TAB Field Acceptance Testing specified by Section 23 05 93 TESTING, ADJUSTING, AND BALANCING FOR HVAC. Include a certification by the Mechanical Technical Specialist that no outstanding deficiencies exist in the systems relative to Testing, Adjusting, and Balancing with the final TAB Report submittal.

3.1.5.5 HVAC Controls Test Reports

The Mechanical System Technical Commissioning Specialist must review the Start-Up Testing Report and the PVT Procedures and Reports required by Specification Section 23 09 00 INSTRUMENTATION AND CONTROL FOR HVAC. Include a certification by the Mechanical System Technical Commissioning Specialist that the submittals contain no deficiencies or that the submittals do not indicate any deficiencies in the HVAC systems or HVAC control systems with each of these submittals.

3.1.5.6 Tests

3.1.5.6.1 Functional Performance and Integrated Systems Tests

Schedule Functional Performance Tests for each system only after the Certificate of Readiness has been approved by the Government for the system. Correct all deficiencies identified through any prior review, inspection, or test activity before the start of Functional Performance Tests. Perform Integrated Systems Tests only after the Functional Performance Tests for each associated system are completed with all deficiencies resolved and after the related Functional Performance Test Checklists have been signed by each commissioning team member.

a. Functional Performance Tests and Integrated Systems Tests must be performed with the Contracting Officer's Quality Assurance Representative present.

b. Abort Functional Performance Tests or Integrated Systems Tests when any system deficiency prevents the successful completion of the test.

c. Technical Commissioning Specialists must lead and document all

Functional Performance Tests and Integrated Systems Tests for the systems to be commissioned with the Contractor and appropriate sub-contractors performing the Functional Performance Tests and Integrated Systems Tests. The representatives listed in the paragraph Commissioning Team must attend the tests. Abort Functional Performance Tests or Integrated Systems Tests when any required commissioning team member is not present for the test.

3.1.5.6.1.1 Checklist

Use the Functional Performance Test and Integrated Systems Test Checklists from the approved Final Construction Phase Commissioning Plan to guide the Functional Performance Tests and Integrated Systems Tests. Functional Performance Tests must be performed for each item of equipment and each system required to be commissioned and verify all sensor calibrations, control responses, safeties, interlocks, operating modes, sequences of operation, capacities, lighting levels, and all other performance requirements comply with construction contract regardless of the specific items listed within the Functional Performance Test and Integrated Systems Test Checklists provided. Testing must progress from equipment or components to subsystems to systems to interlocks and connections between systems. Integrated Systems Tests must be performed for the interactive operation between systems such as HVAC systems, fire protection systems, back-up electrical supply, energy generation systems, and other systems, and verify correct interactive operation, acceptable speed of response, and other contract requirements for both normal and failure modes. Examples of Integrated Systems Tests include the correct operation of HVAC systems during emergency system activation, correct operation of uninterruptible power supplies or energy generators and connected systems, or lighting system operation during power outage or emergency system activation.The order of components and systems to be tested must be determined by the Technical Commissioning Specialists.

3.1.5.6.1.2 Acceptance

Indicate acceptance of each item of equipment and systems tested by signature of each commissioning team member for each Functional Performance Test or Integrated Systems Test Checklist. The Contractor's Quality Control Representative and the Technical Commissioning Specialists must indicate acceptance after the equipment and systems are free of deficiencies.

3.1.5.6.2 HVAC Test Methods

Perform Functional Performance Tests in accordance with the following:

3.1.5.6.2.1 Prior to Testing

Prior to testing operating modes, sequences of operation, interlocks, and safeties, complete control point-to-point observations, test sensor calibrations, and test actuator commands.

3.1.5.6.2.2 Simulating Conditions

Over-writing control input values through the controls system is not acceptable, unless approved by the Contracting Officer's Representative. Identify proposed exceptions in a protocol submitted to the Contracting Officer's Representative for approval. Before simulating conditions, overwriting values (if approved), or changing set-points, calibrate all

sensors, transducers and devices. Below are several examples of exceptions that would be considered acceptable:

a. When varying static pressures inside ductwork can not be simulated within the duct, and where a sensor signals the controls system to initiate sequences at various duct static pressures, it is acceptable to simulate the various pressures with a Pneumatic Squeeze-Bulb Type Signaling Device with gauge temporarily attached to the sensing tube leading to the transmitter. It is not acceptable to reset the various set-points, nor to simulate an electric analog signal (unless approved as noted above).

b. Dirty filter pressure drops can be simulated using sheets of cardboard at filter face.

c. Freeze-stat safeties can be simulated by packing portion of sensor with ice.

d. High outside air temperatures can be simulated with a hair blower.

e. High entering cooling coil temperatures can be used to simulate entering cooling coil conditions.

f. Do not use signal generators to simulate sensor signals unless approved by the Contracting Officer's Representative , as noted above, for special cases.

g. Control set points can be altered. For example, to see the air conditioning compressor lockout work at an outside air temperature below 55 degrees F, when the outside air temperature is above 55 degrees F, temporarily change the lockout set point to be 0 degrees F above the current outside air temperature. Caution: Set points are not to be raised or lowered to a point such that damage to the components, systems, or the building structure and/or contents will occur.

h. Test duct mounted smoke detectors in accordance with the manufacturer's recommendations. Perform the tests with air system at minimum airflow condition in ductwork.

i. Test current sensing relays used for fan and pump status signals to control system to indicate unit failure and run status by resetting the set point on the relay to simulate a lost belt or unit failure while the unit is running. Confirm that the failure alarm was generated and received at the control system. After the test is conducted, return the set point to its original set-point or a set-point as indicated by the Contracting Officer's Representative .

3.1.5.6.2.3 Setup

Perform each test under conditions that simulate actual conditions as close as is practically possible. Provide all necessary materials and system modifications to produce the necessary flows, pressures, temperatures, and other conditions necessary to execute the test according to the specified conditions. At completion of the test, return the affected building equipment and systems to their pre-test condition.

3.1.5.6.3 Sample Strategy

Perform Functional Performance Tests using a 100 percent sample size.

Where multiple similar systems or pieces of equipment are provided. Prepare and complete a Functional Performance Test Checklist for each item of equipment or system to be tested.

Perform Integrated Systems Tests for all systems and equipment having interactive operation.

3.1.5.6.4 Aborted Tests and Re-Testing

Abort Functional Performance Tests, Integrated Systems Tests, or Seasonal Tests if any deficiency prevents successful completion of the test or if any required commissioning team member is not present for the test. Reimburse the Government for all costs associated with effort lost due to re-testing due to test failures and aborted tests. These costs must include salary, travel costs, and per diem for Government commissioning team members. Re-test only after all deficiencies identified during the original tests have been corrected.

3.1.5.6.4.1 100 Percent Sample

Systems or equipment for which 100 percent sample size are tested fail if one or more of the test procedures results in discovery of a deficiency and the deficiency cannot be resolved within 5 minutes during the test.

Re-test to the extent necessary to confirm that the deficiencies have been corrected without negatively impacting the performance of the rest of the system.

3.1.5.6.4.2 Less than 100 Percent Sample

For systems tests with a sample size less than 100 percent, if one or more of the test procedures for an item of equipment or a system results in discovery of a deficiency, regardless of whether the deficiency is corrected during the sample tests, the item of equipment or system fails the test.

a. If the system failure rate is 5 percent or less, meaning that 5 percent or less of the equipment or systems had at least one deficiency, re-test only on the items which experienced the initial failures.

b. If the system failure rate is higher than 5 percent, meaning that more than 5 percent of equipment or systems tested had at least one deficiency, re-test the items which experienced the initial failures to the extent necessary to confirm that the deficiencies have been corrected . In addition, test another random sample of the same size as the initial sample for the first time. If the second random sample set has any failures, re-test those failed items and all remaining equipment and systems to complete 100 percent testing of that system type.

3.1.6 Training Plan

Develop a training plan which identifies all training required by specification sections associated with commissioned systems. Include a matrix listing each training requirement, content of the training, the trainer name, trainer contact information, and schedule and location of training. Submit one hard copy and an electronic copy of the Training Plan to the Commissioning Specialists and the Government no later than 30

calendar days prior to the associated training.

Document training attendance using training attendance rosters and provide completed attendance rosters to the Commissioning Specialists and the Government no later than 7 calendar days following the completion of training for each system to be commissioned. Submit one hard copy and an electronic copy.

3.1.7 Systems Manual

Prepare and submit a Systems Manual including, for all commissioned systems, the Basis of Design, system single line diagrams, as-built sequences of operation and controls drawings, as-built control setpoints, recommended schedule for sensor and actuator calibration, recommended schedule of maintenance when not in the O&M manuals, recommended re-testing schedule with proposed testing forms, and full equipment warranty information. Update and resubmit the Systems Manual based on any corrective action taken during the warranty period. The Technical Commissioning Specialists must review the Systems Manual. Include a signed certification or letter from the Lead Commissioning Specialist stating that the Systems Manual is complete, clear, and accurate with the submittal.

Submit Systems Manual no later than 30 calendar days following completion of Functional Performance Tests. Submit three hard copies and an electronic copy.

3.1.8 Maintenance and Service Life Plans

3.1.8.1 Maintenance Plan

Prepare and submit a Maintenance Plan for the project mechanical, electrical, plumbing, and fire protection systems. Prepare the HVAC and refrigeration sections of the Maintenance Plan in accordance with ASHRAE 180. Develop required inspection and maintenance tasks similar to Section 5 of ASHRAE 180 for the other commissioned systems and fire protection systems.

Submit the Maintenance Plan no later than 30 calendar days following the completion of Functional Performance tests. Submit three hard copies and an electronic copy.

3.1.8.2 Service Life Plan

Prepare and submit a Service Life Plan for the building envelope, structural systems, and site hardscape that includes the following for each assembly or component:

a. A description of each including the materials or products.

b. The estimated service life, in years.

c. The estimated maintenance frequency and description of maintenance tasks.

d. The point of maintenance access for the components with estimated service life less than service life of the building.

Submit the Service Life Plan no later than 30 calendar days following the

completion of Functional Performance tests. Submit three hard copies and an electronic copy.

3.2 COMMISSIONING REPORT

Following the completion of Functional Performance Tests and Integrated Systems Tests, with the exception of Seasonal Tests, the Lead Commissioning Specialist must prepare a Commissioning Report.

a. Include an executive summary describing the overall commissioning process, the results of the commissioning process, any outstanding deficiencies and recommended resolutions, and any seasonal testing that must be scheduled for a later date. Indicate, in the executive summary, whether the systems meet the requirements of the construction contract and the Owner's Project Requirements.

b. Detail any deficiencies discovered during the commissioning process and the corrective actions taken in the report. Include the completed Building Envelope Inspection Checklists, Pre-Functional Checklists, Functional Performance Test Checklists, Integrated Systems Test Checklists,the Commissioning Plans, the Issues Log, Performance Verification Test Reports, Training Attendance Rosters, the Design Review Report, the final TAB Report.

c. Submit the Commissioning Report no later than 14 calendar days following commissioning team acceptance of all Functional Performance Tests and Integrated Systems Tests with the exception of Seasonal Tests. Submit three hard copies and an electronic copy.

d. Following any Seasonal Tests or Post-Construction Activities, update the Final Commissioning Report to reflect any changes and resubmit.

**APPENDIX A - OWNER'S PROJECT REQUIREMENTS**

**OWNER'S PROJECT REQUIREMENTS DOCUMENT**

Provided as attachment "Appendix A-OPR"

## APPENDIX B - BASIS OF DESIGN

Included as attachment "Design Analysis"

-- End of Section --

**This page was intentionally left blank for duplex printing.**

## 1. Owner and User Requirements

### a. Primary Purpose, Program, and Use

The project is required for down range firefighting support at Ft Carson, CO. The scope is to design a small non-standard fire station at Gate 6, to support increased training requirements and new training ranges. This project will include an apparatus bay for fire trucks; a residential/living area to include five dorm/sleeping rooms, a kitchen, dayroom, work out area, and the administration area for basic operations and training. The building will also provide back-up emergency power for the whole facility.

### b. Project History

This in-house design-bid-build project is required to support the Fort Carson fire-fighting department in the suppression of wildfires in the surrounding areas. Existing Facilities are decaying and outdated requiring a new fire station to continue operation.

### c. Broad Goals

i. Quality of Materials: Facilities will be designed to a minimum life of 40 years in accordance with DoD's Unified Facilities Criteria (UFC 1-200-02) including energy efficiencies, building envelope and integrated building systems performance.

ii. Construction Costs: An economic analysis has been prepared and utilized in evaluating this project. The project design will use the most cost-effective methods to satisfy all applicable HPSB requirements.

iii. Operational Costs: The PDT performed Energy Modeling during phases of design, including size, material choices, and energy system choices (solar water heat, multiple heating and cooling system configurations) to analyze and demonstrate how the project will optimize these factors for efficient building operation and resource consumption.

## 2. Environmental Goals

### a. LEED/GPC Goals

- Meet Ft. Carson's Net Zero Energy Initiatives.
- The project must implement Post-Development storm-water controls that return the developed area to pre-development hydrology. This is a requirement of Section 438 of the Energy Independence and Security Act (EISA).
- The difference in discharge between the pre- construction condition and the proposed impacted condition will be the minimal target amount that will be required to be mitigated through permanent BMP design. The BMP design will address storms with a five-year return period or less and should account for the pre-development temperature, discharge rate, volume, and duration of flow.
- The BMP designs will be constructed to mitigate the change in flow and volume while passing the 25-year native flow characteristics downstream. To achieve this requirement, Low Impact Development (LID) measures must be included in the design. These can include infiltration basins,

bio-retention swales, rain gardens, underground retention/infiltration, etc.

- NEPA: a. Storm water management is required for each project. Storm water can be managed by bio-filtration areas and small detention ponds.
- Each project will require a REC when they reach a stage in development (usually the 60% design) that is not apt to change to ensure site- specific mitigation is addressed.

**3. Energy Efficiency Goals**

**a. Goals/Policy**

- Facilities will be designed to a minimum life of 40 years in accordance with DoD's Unified Facilities Criteria (UFC 1-200-02) including energy efficiencies, building envelope and integrated building systems performance.
- The project will meet LEED Silver criteria.
- Meet the requirements of ASHRAE 90.1.
    - Design the building to achieve at least 30% energy consumption reduction from ASHRAE 90.1 baseline.
    - If a 30% reduction is not LCCE, modify the design of the proposed building to achieve an energy consumption level at the highest level of energy efficiency that is LCCE.
    - Determine energy consumption levels for both the ASHRAE Baseline Building and proposed building alternatives by using the Performance Rating Method found in appendix G of ASHRAE 90.1, except the formula for calculating the Performance Rating. Replace the formula in G1.2 with the following:
    - Percentage improvement = 100 × ((Baseline building consumption − Receptacle and process loads) − (Proposed building consumption − Receptacle and process loads)) / (Baseline building consumption − Receptacle and process loads).
- Per EISA 2007 Section 525, acquire products that are ENERGY STAR®-qualified or meet FEMP-designated efficiency requirements in all covered product categories. Select products based on life cycle cost, not initial cost.

**b. Systems and Feature Energy Impacts**

Identify and explain envelope, system, or site and building features that will be incorporated to maximize energy efficiency. Identify features that must be incorporated that will reduce or limit energy efficiency.

- Standby Powered Devices
- Per EISA 2007 Section 524, provide commercially available, off-the-shelf products that use no more than 1 watt in their standby mode.
- Metering
    - A utility meter must be installed at each building, for each utility serving the building (electricity) in the standard units of the measure. Base-wide energy and utility monitoring and control systems does not exist at the site, therefore meters will not be connected to the EMCS. The installation of meters is required per DODI 4170.11, and as amended by DOD *Utilities Meter Policy*, 16 April 2013. Meter configuration must comply with requirements of UFC 4-010-06.

**4. Protect and Conserve Water**

- Indoor Water.
    - Meet the requirements of ASHRAE 189.1 Section 6.3.2 (Building Water Use Reduction), which incorporates EPA Water-Sense-labeled products. Water closet replacements in renovations may have a flush value of up to 1.6 GPF (6.1 LPF) to accommodate existing plumbing infrastructure. Fixtures used for sanitizing potential biohazards are exempt from low-flow and Water-Sense labeling requirements.
    - Meet the requirements of ASHRAE 189.1 Section 6.4.2 (Building Water Use Reduction).
    - Meet the requirements of ASHRAE 189.1 Section 6.4.3 (Special Water Features).
- Indoor Water Metering.
    - Install advanced water meters to monitor building indoor potable water consumption, as required by DOD Utilities Meter Policy, 16 April 2013. Meter configuration must comply with requirements of UFC 4-010-06.
- Storm-water Management.
    - Meet the requirements of UFC 3-210-10

**5. Indoor Environmental Quality Requirements:**

- Ventilation and Thermal Comfort
    - Comply with UFC 3-410-01 for ventilation and thermal comfort criteria. Consider the use of passive (non-mechanical) thermal comfort methods as described in paragraph entitled, "Integrated Design" in this UFC.
- Daylighting and Lighting Controls
    - Locate all regularly occupied spaces, such as classrooms and offices, on exterior walls or other locations where it is feasible to provide daylighting. Meet the requirements of ASHRAE 189.1 Section 8.4.1.2 (Minimum Side-lighting effective Aperture for Office Spaces and Classrooms) or Section 8.5.1.2 (Usable Daylight Illuminance in Office Spaces and Classrooms). Provide automated lighting controls in accordance with UFC 3-530-01.
- Reduce Volatile Organic Compounds (VOC) (Low-Emitting Materials).
- Specify materials and products with low or no pollutant emissions, including composite wood products, adhesives, sealants, interior paints and finishes, carpet systems, and furnishings. Meet the requirements of ASHRAE 189.1 Section 8.4.2 (Prescriptive Option: Materials)

- Protect Indoor Air Quality during Construction.
    - For new construction and for renovation of unoccupied existing buildings, develop and implement an IAQ construction management plan that complies with ASHRAE 189.1 Section 10.3.1.4 (Indoor Air Quality (IAQ) Construction Management), with maximum outdoor air consistent with achieving relative humidity no greater than 60%.

**a. Space Type: Dormitory Sleeping Areas**

i. Intended Use: Sleeping quarters for station fire fighters
ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 5 fc.

iv. Occupant System Control Ability: Ambient lighting will automatically turn on to 50% by occupancy sensor, with a switch to increase light output to 100%. Lighting will turn off after 15 minutes of no occupancy. Occupants will have a controllable thermostat in each bedroom to allow for individual heating and cooling set point control.

v. Type of Lighting: Space will have overhead general lighting with vacancy controlled dimming.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary

**b. Space Type: Kitchen**

i. Intended Use: General living areas

ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 30 fc at the workstations.

iv. Occupant System Control Ability: Lighting will manually turn on to 100% by switch, automatically reducing to 50% by occupancy sensor. Lighting will turn off after 15 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting. Counter space will have additional lighting via under-cabinet lights.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary

**c. Space Type: Crew Open Office**

i. Intended Use: General living areas

ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 30 fc at the workstations.

iv. Occupant System Control Ability: Lighting will manually turn on to 100% by switch, automatically reducing to 50% by occupancy sensor. Lighting will turn off after 15 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary

**d. Space Type: Day Room**

i. Intended Use: General living areas

ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 30 fc at the workstations.

iv. Occupant System Control Ability: Lighting will manually turn on to 100% by switch, automatically reducing to 50% by occupancy sensor. Lighting will turn off after 15 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary

**e. Space Type: Fitness Room**

i. Intended Use: Fitness area

ii. Occupancy Schedule: 24/7.

iii. Environmental Requirements: The area will be continuously conditioned to 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 30 fc at the workstations.

iv. Occupant System Control Ability: Ambient lighting will automatically turn on to 50% by occupancy sensor, with a switch to increase light output to 100%. Lighting will decrease to 50% after 15 minutes of no occupancy, lighting will turn off after 20 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary

**f. Space Type: Telecommunications Room**

i. Intended Use: The communications room is for the dedicated operation of the communications infrastructure of the facility.

ii. Occupancy Schedule: This space is not routinely occupied.

iii. Environmental Requirements: The area will be continuously conditioned to 72 with ventilation complying with ASHRAE 62.1. Target lighting level is 50 fc 3’-0” above finished floor.

iv. Occupant System Control Ability: Lighting will turn on to 100% at switch, lighting will turn off at switch.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This area’s operation will not change due to time of day.

**g. Space Type: Apparatus Bays**

i. Intended Use: Provide housing for fire-fighting apparatuses and fire-fighting equipment as well as a workroom for general maintenance of equipment.

ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned above 55°F with exhaust cooling. Fire-fighting apparatuses will be provided with vehicle exhaust. The ventilation system will provide constant ventilation complying with ASHRAE 62.1 minimums. Target lighting level is 30 fc at the workstations. Target lighting level is 50 fc at 2’-6” above finished floor.

iv. Occupant System Control Ability: Ambient lighting will automatically turn on to 50% by occupancy sensor, with a switch to increase light output to 100%. Lighting will decrease to 50% after 15 minutes of

no occupancy, lighting will turn off after 20 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting with daylight controlled dimming.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary.

**h. Space Type: Workroom**

i. Intended Use: Provide a workroom for general maintenance of equipment.

ii. Occupancy Schedule: 24/7

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1. Target lighting level is 30 fc at the workstations. Target lighting level is 50 fc at 2'-6" above finished floor.

iv. Occupant System Control Ability: Ambient lighting will automatically turn on to 50% by occupancy sensor, with a switch to increase light output to 100%. Lighting will turn off after 15 minutes of no occupancy. Lighting to include fire alarm hold-on.

v. Type of Lighting: Space will have overhead general lighting with daylight controlled dimming.

vi. After-hour Use Accommodations: This space will be occupied and in use 24/7 thus no after-hour use accommodations are necessary.

**i. Space Type: Circulation (Corridor and Vestibule)**

i. Intended Use: Facilitate inter-facility movement and emergency egress.

ii. Occupancy Schedule: This space is not routinely occupied.

iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1.

iv. Occupant System Control Ability: Ambient lighting is 24-hour operation, Fixtures will automatically turn on to 100% by occupancy sensor. Lighting will decrease to 50% after 10 minutes of no occupancy.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**j. Space Type: Storage Rooms**

i. Intended Use: Storage of facility offices

ii. Occupancy Schedule: This space is not routinely occupied.

iii. Environmental Requirements: This space is not directly conditioned or ventilated.

iv. Occupant System Control Ability: Fixtures will manually turn on to 100% by switch. Lighting will decrease to 0% after 10 minutes of no occupancy via vacancy sensor.

v. Type of Lighting: Space will have overhead general lighting.

vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**k. Space Type: Electrical Room**

i. Intended Use: Room for building electrical equipment
ii. Occupancy Schedule: This space is not routinely occupied.
iii. Environmental Requirements: This space will be conditioned between 70°F and 74°F.
iv. Occupant System Control Ability: Manual Controls Only.
v. Type of Lighting: Space will have overhead general lighting.
vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**l. Space Type: Mechanical Room**

i. Intended Use: Room for building mechanical equipment
ii. Occupancy Schedule: This space is not routinely occupied.
iii. Environmental Requirements: This space will be heated to 55°F and exhaust cooled.
iv. Occupant System Control Ability: Manual Controls Only.
v. Type of Lighting: Space will have overhead general lighting.
vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**m. Space Type: Restrooms**

i. Intended Use: toilet and shower rooms for building occupants
ii. Occupancy Schedule: This space is not routinely occupied.
iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1.
iv. Occupant System Control Ability: Lighting will automatically turn to 100% when occupancy sensor activates. Lighting will reduce to 50% after no occupancy, and 0% after 20 minutes. Lighting to include fire alarm hold-on.
v. Type of Lighting: Space will have overhead general lighting. Vanity will have additional light via wall-mounted lights above mirrors.
vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**n. Space Type: Laundry Room**

i. Intended Use: provide room for building occupants to wash clothes and gear as well as provide janitorial functions
ii. Occupancy Schedule: This space is not routinely occupied.
iii. Environmental Requirements: The area will be conditioned between 68°F and 75°F with ventilation complying with ASHRAE 62.1.
iv. Occupant System Control Ability: Ambient lighting is 24-hour operation, Fixtures will automatically turn on to 100% by occupancy sensor. Lighting will decrease to 50% after 10 minutes of no occupancy.
v. Type of Lighting: Space will have overhead general lighting.
vi. After-hour Use Accommodations: This area's operation will not change due to time of day.

**6. Equipment and System Expectations**

**a. HVAC Systems**

i. Quality and Reliability: The heating system will have redundant pumps with 2 boilers each sized for 60% of the full load. The cooling system will be an air-cooled chiller.

ii. Type: Boilers should be condensing type. Use self-contained A/C units in telecommunication rooms.

iii. Automation: Control HVAC systems from DDC system not connected to the Installation EMCS.

iv. Maintenance Requirements: Equipment should be located to allow easy maintenance access. Equipment vendors or repair service should be able to respond within 24 hrs.

**b. Lighting Systems**

i. Quality and Reliability: The building lighting system should meet ASHRAE 90.1 - IP requirements.

ii. Type: High-efficiency LED fixtures shall be specified. Direct lighting will be used in all spaces. Lighting levels shall be per IESNA.

iii. Automation: Explain the level of automation in the lighting control system desired.

Occupancy/Vacancy sensors shall be provided in all areas excluding utility spaces.

iv. Flexibility: Describe the desired level of flexibility of the lighting system and control systems.

Occupied spaces shall have occupancy sensors with a manual switch to increase light levels. Utility spaces shall have manual on and off controls.

v. Maintenance Requirements: Equipment should be located to allow easy maintenance access. Equipment vendors or repair service should be able to respond within 24 hrs.

**c. Domestic Hot Water Systems**

i. Quality and Reliability: The hot water system should consist of equipment to meet "peak demand" delivery requirements. Equipment efficiency should meet ASHRAE and FEMP/Energy Star requirements.

ii. Type: Propane gas-fired water heater with mixing valve for temperature control of whole building domestic water supply system plus separate mixing valve for the emergency/eyewash shower.

iii. Automation: Occupancy schedule control for the domestic hot water recirculation system. Control the recirculation system through the DDC system

iv. Flexibility: No anticipated future changes to restroom layout; no additional flexibility required.

v. Maintenance Requirements: Equipment should be located to allow easy maintenance access. Equipment vendors or repair service should be able to respond within 24 hrs.

**7. Building Occupant and O&M Personnel Requirements**

a. Facility Operation

The DPW is the proponent for facility operations on Fort Carson. The Facility Manager serves as the DPW's primary liaison and assists with facility inspections, maintenance and repairs to ensure proper

building operation. Facility manager duties are consistent with occupant-level knowledge and do not require professional expertise.

b. EMCS

The building will not be tied to the installation wide EMCS.

c. Occupant Training and Orientation

The subcontractors shall compile and prepare data and deliver to the Contractor prior to the training of Government personnel. The Contractor shall compile and prepare aggregate O&M data including clarifying and updating the original sequences of operation to as-built conditions.

d. O&M Staff Training and Orientation

The contractor shall develop a training plan, which identifies all training required by specification sections associated with commissioned systems. This information shall include a matrix listing each training requirement, content of the training, the trainer name, trainer contact information, and schedule and location of training.

# PART 1 - GENERAL PROJECT INFORMATION

## 1 PURPOSE

This Design Analysis and accompanying drawing package provide the Basis of Design for a new Fire Station Support Building to be located at Gate 6 at Fort Carson, Colorado.

## 2 AUTHORIZATION

This FY23 project was programmed and authorized by Code 6 Design Directive issued by HQUSACE (CEMP-IA) 16 April 2018 and by the DD1391 dated 24 September 2009, revised DD1391 dated 19 May 2016, revised DD1391 dated 27 March 2018, revised DD1391 date 21 October 2021, and subsequently revised DD1391 dated 31 March 2022.

## 3 APPLICABLE CRITERIA

a. Code 6 Design Directive dated 12 April 2018
b. DD 1391 dated 31 March 2022
c. Kick-Off Meeting Minutes and Trip Report dated 13 August 2018
d. DD1391 Scope Discussion Minutes dated June 14, 2022
e. UMMCA Validation Report dated 2 November 2018
f. See Criteria References include in Part 2 – Design Requirements and Provisions.

## 4 PROJECT DESCRIPTION

This project is to construct a small non-standard Fire Station Support Facility at Gate 6, Fort Carson, CO to support increased training requirements and support new training ranges at Fort Carson. The facility will be in support of the Main Fire Station functions at Fort Carson. The new Fire Station Support Facility is located immediately north of Gate 6 on Wilderness Road and is for early response to downrange training areas and ranges. The facility will provide services for life and health safety as well as wild land fire response. The location of the Fire Station Support Facility will facilitate providing early evaluations of incidents and be able to engage additional support services when necessary.

The project objective is to provide Apparatus Bays for four fire trucks/support vehicles; a Residential area with five Dorm Rooms (the area where the firemen sleep, shower, eat and relax) and the Administration area for basic operations, communications, and training.

# PART 2 – DESIGN REQUIREMENTS AND PROVISIONS

## 1 SITE/CIVIL

### 1.1 PROJECT DESCRIPTION

This project encompassed the design of a new fire station located just north of Gate 6 at Fort Carson. A previous design for this fire station was located approximately 4 miles to the south, near the Turkey Creek Historical Area. Any elements of design that could be kept from the previous design were retained. The new fire station included site features as follows: concrete drives and access road, concrete parking lot, storm drainage around facility, grading and blending with the surrounding site along with maintaining visual site of the mountains located directly west. Site utilities included water, fire, storm, sanitary sewer, industrial waste, electrical, communications, and LP gas supply. Concrete sidewalks and patio were provided to the front and rear entrances, respectively.

### 1.2 DESIGN REFERENCES

## 1.3 DEMOLITION

Demolition includes removing two existing concrete pads, a portion of the aggregate/unsurfaced perimeter road, 2 culverts running under this portion of the road, a short length of the perimeter security fence, and clearing and grubbing of the immediate site. Special care should be taken when removing the perimeter road, due to a water main located nearby. According to the installation, it is deep enough to not interfere with demolition and new construction, but contractors should remain aware. Tree removal is not anticipated.

## 1.4 SITE PLANNING

The following criteria were used in the design of the site.

### 1.4.1 Building Location

The originally proposed location for the facility was located approximately 4 miles south, off Turkey Creek Road. This location was changed due to excess cost of the project, resulting primarily from its remote location. That remoteness caused longer utility runs, the need for additional infrastructure (including a pump house, gas storage tank, and sanitary sewage holding tank), and increased maintenance costs. The new site was chosen to mitigate many of these issues. The gas, water, sewer, and communications can be drawn from lines running along Wilderness Road. Electrical is the sole exception to this. More information can be found in the electrical sheets and DA. The final location of the building was also determined by considering future expansion of Gate 6, along with the user's desire to have the building located further north. The utility runs (primarily water) determined how far north the building could be placed.

### 1.4.2 Force Protection

This facility was determined to be low occupancy during the 2018 design charrette, therefore, not required to meet the minimum requirements of UFC 4-010-01.

### 1.4.3 Site Structures

Two enclosed 8 CY dumpsters were located southwest of the Fire Station to allow quick access and turnaround from the road for serviceability. Near the dumpster enclosure was a 1,000 gallon fuel tank enclosed in a 7 ft chain link fencing with gate access for safety. A transformer and generator were located across the drive, adjacent to the facility.

### 1.4.4 Vehicle Circulation & Emergency Access

The vehicle circulation was designed to allow Fire Station personnel to respond to fires both to the east of the site, and downrange, to the south. This created the need for two entrances onto Wilderness road, one east of Gate 6, and one west. Both entrances are connected via an access road. This road replaces the existing perimeter road in the area. The fire station is connected to the access road via two drives, leading to each side of the vehicle bay. A parking area is located between the facility and the access road, with space for (13) POVs. The drives and road were designed to accommodate the turning radii of emergency vehicles. The orientation of the fire station was chosen to prevent snow melt from freezing up near the bays of the facility.

### 1.4.5 **Leed Compliance**

Site grading and features were designed in a manner to comply with LEED Version 4 as much as feasible within the allowed programmed amount and Army regulations. A bicycle rack was placed at the front of the building. Albedo of aggregate and concrete surfaces was considered and incorporated into specifications. Storm water routing and temporary detention was considered for LEED purposes as well as all other design requirements.

### 1.4.6 **Planting**

The general area of the site was determined by the Colorado State Forest Service as a High Risk Burn Probability in the event of a wildfire. Executive Order 13729 requires wildfire risk mitigation must be complied with where there exists a moderate to high risk of probability. Therefore, coordination with the Fire Protection Engineer was performed and direction was given to disallow vegetation within 30 feet of all structures and site features. As a result, the design included a 30-foot exclusion zone consisting of concrete pavement, aggregate surfacing, and rock mulch to meet these requirements.

#### 1.4.6.1 **Turf & Rock Mulch**

No vegetation was allowed within 30 feet of all structures and site features as described above. Therefore, rock mulch was designed to be located around these locations. Color was specified as shown on the drawings. Mulch Type “A” was defined in the specifications as 1-1/2” red dolomitic limestone and Mulch Type “B” was defined as 1-1/2” blue-grey river gravel. Weed control fabric and edging were also incorporated into the detail drawings for long term maintenance and establishment.

The intent was to match the existing field conditions with native grasses; however, this would create negative impacts in the event of a wildfire. Therefore, the Fort Carson “Field Mix” was specified between rock mulch and existing conditions outside the grading limits.

## 1.5 GRADING

The following criteria were used to develop site grading.

- Minimum Crown grade of 2 percent.
- Minimum desirable gutter grade of 0.8 percent with absolute minimum of 0.5 percent.
- Desirable minimum transverse parking area grade of 2 percent. Absolute minimum grade of 1.5 percent for flexible pavement and 1 percent for rigid pavement.
- Maximum desirable parking area grade of 4 percent.
- Maximum desirable ramp grade of 7 percent. Absolute maximum ramp grade of 10

percent for short distances only.

- Desirable minimum grade of 5 percent for 10 feet away from building and desirable maximum grade of 10 percent for 10 feet.

- Minimum grade of 1 percent for overlot grading for cohesionless sandy soils and 2 percent for cohesive soils or turf areas.

- Minimum ditch grade of 0.3 percent.

- Maximum fore-slopes of 1V on 4H and back-slopes of 1V on 3H.

- Maximum longitudinal walk grade of 10 percent in freezing climates and 15 percent in nonfreezing climates. Walks that are classified as handicapped accessible shall have grades not exceeding 5 percent where possible. If a handicapped ramp is required, the ramp shall have a maximum slope of 8.333 percent (1:12) slope with 5 feet level landings at 30 feet maximum spacing at the top and bottom of the slope.

- Transverse walk grade of 2 percent.

## 1.6 PAVEMENT DESIGN

### 1.6.1 Rigid Pavement

The access road and drives were designed utilizing Pavement-Transportation Computer Assisted Structural Engineering (PCASE) Software Version 2.09.05 as required by UFC 3-250-01. Pavement was designed to meet 25-year design life requirements. Recommendations from the Geotechnical Report were applied to the design to meet minimum requirements. Local climate and frost depth were applied to design along with estimated traffic patterns.

The recommended pavement section as per PCASE (including reduced subgrade strength) was established below:

Rigid Pavement:
7.5” Concrete Pavement
7” Aggregate Base
12” Compacted Subgrade (95%)

### 1.6.2 Aggregate Surfacing

The access road and drives could be designed with aggregate to reduce cost, if necessary. PCASE was used to design the section as well with a CBR value of 11 as per the Geotechnical Report. Due to the low CBR a drainage layer and geotextile material was required to prevent premature failure of subgrade, especially with frost-susceptible conditions present.

The recommended pavement section as per PCASE (including reduced subgrade strength) was established below:

Aggregate Surfacing:
6” Aggregate Surface
6” Drainage Material
Geotextile Material
12” Compacted Subgrade (95%)

### 1.6.3 Subgrade Compaction

Additional verbiage was provided within the earthwork specifications regarding rutting of subgrade during proof roll operations. As an alternative the Contractor was provided the option to over-excavate a minimum of 12 inches and install geogrid and 1.5 inch – minus aggregate material per specifications.

### 1.6.4 Pedestrian Circulation

Sidewalks were designed to meet ADA / ABA requirements at all entry / exits locations of each building as well as the patio area connected to the Fire Station. Sidewalks widths varied from 4 – 6 feet wide depending on frequency of use. Pavement was designed to be 4” Portland Cement Concrete (PCC) with minimum compressive strength of 3500 psi with air entrainment. Notes were added to the design drawings for coordination with the structural drawings at all stoop locations.

## 1.7 DRAINAGE

Storm drains were designed in accordance with AC 150/5320-5D.

### 1.7.1 Design Storm Period

Storm drains and culverts were design with a return period of 10 years. The detention basin was designed to route the 100-year storm event with larger storm events passing over a designed weir. This is required by the City of Colorado Springs and recommended by the Colorado Urban Drainage Criteria Manual.

### 1.7.2 Design Methodology

A preliminary layout of the storm drains and culverts was created based upon the existing drainage and proposed grading. Drainage area and design flow rates were determined at each inlet point. Area inlets were placed in low points of unsurfaced areas and sized according to HEC-22. The storm drainpipe network was designed using Bentley InRoads Drainage.

As per direction of Fort Carson Directorate of Public Works, the storm water system was required to meet the most stringent of federal, state, and local design criteria. These requirements were researched extensively, and the following conclusions were drawn. The Unified Facility Criteria included requirements to meet EISA 438 by designing to UFC 3-210-10 Low Impact Development. The Turkey Creek Fire Station was located within El Paso County and the Design Criteria requirements were not as stringent as the City of Colorado Springs. Further, the El Paso Design Criteria referenced the City of Colorado Springs Design Criteria on numerous occasions. The City of Colorado Springs Design Criteria was researched it was discovered the Colorado Urban Drainage Criteria Manual was recommended to be followed with a few exceptions (i.e. vegetation). While not explicitly required, the Urban Drainage Criteria Manual provided clear guidance along with the necessary design software to meet all federal, state, and local requirements. The software was able to temporarily detain the storm water runoff, provide water quality requirements and flow the runoff downstream within a period of 72 hours as required by state law.

### 1.7.3 Storm Runoff

Storm drains and culverts were sized to accommodate design storm peak discharge. The peak discharge was determined using the Rational Method and calculations were provided within the appendix. It should be noted the design software was downloaded from the Mile High Flood

District website and the 1-hour rainfall depth information was gathered from the following link:

https://hdsc.nws.noaa.gov/hdsc/pfds/pfds_map_cont.html?bkmrk=co

#### 1.7.3.1 Rational Method

In the rational method, peak discharge is related to rainfall intensity by the formula:

Q= CiA

##### 1.7.3.1.1 Runoff Coefficient

The runoff coefficient, C, accounts for the integrated effects of rainfall interception, infiltration, depression storage, and temporary storage in transit on the peak rate of runoff. A full description of the coefficients used can be found within the appendix.

##### 1.7.3.1.2 Rainfall Intensity

The rainfall intensity, i, represents the average intensity over a duration equal to the time of concentration for the catchment. Intensity-Duration curves were taken from the NOAA website at a nearby weather station within Penrose, Colorado. The Precipitation intensity information can be found within the appendix for reference. The link to the NOAA website is shown below:

https://hdsc.nws.noaa.gov/hdsc/pfds/pfds_map_cont.html?bkmrk=co

Additionally, the spreadsheet published by the UDFCD incorporated intensity coefficients as shown within the appendix.

##### 1.7.3.1.3 Contributing Area

The contributing area, A, in the rational formula equated to the total disturbed area on site. Because the location of the site rests near the top of a berm there was no upstream drainage used within the calculations.

### 1.7.4 Pavement Drainage

The capacities of concrete gutters were determined in accordance with FHWA HEC No. 22 using a Manning roughness coefficient of 0.016. Inlets along gutters of parking lots are sized and spaced to allow water to flood not more than half the lane width away from the gutter. Inlets in parking areas are sized to allow water to pond to a maximum depth of 6 inches.

### 1.7.5 Storm Drainage System Design

#### 1.7.5.1 Manholes

Manholes were located at intersections, changes in alignment or grade and at intermediate joints in the system up to every 300 feet. Manhole inverts were designed to minimize hydraulic losses through them. Fixed ladders were not provided in manholes at Ft. Carson.

#### 1.7.5.2 Storm Drain Pipe Hydraulic Design

Storm drainpipes are sized to flow full at the 10-year design discharge.

The hydraulic grade line was determined throughout the new storm drainage system to establish the elevation to which water will rise when the system is operating under design conditions. The hydraulic grade line was calculated using the energy loss methodologies in FHWA HEC No. 22.

The minimum allowable pipe diameter is 12 inches for runs 100 feet or less. The minimum allowable pipe diameter is 15 inches for runs over 100 feet. Storm drainpipes are designed to provide a minimum velocity of 2.5 ft/sec when pipes are flowing 1/3 full to prevent the excessive deposition of solid materials. Pipe flow was determined using the following Manning roughness coefficients:

| Pipe Material | Roughness Coefficient |
|---|---|
| Concrete Pipe | 0.012 |
| Plastic Pipe (smooth) | 0.01 |
| Unpaved Corrugated Steel Pipe | 0.024 |
| **(2-2/3"x1/2" Annular Corrugations)** | |
| Unpaved Corrugated Steel Pipe | 0.024 |
| **(2-2/3"x1/2" Helical Corrugations)** | |
| 12-inch | 0.011 |
| 15-inch | 0.012 |
| 18-inch | 0.013 |
| 24-inch | 0.015 |
| 30-inch | 0.017 |
| 36-inch | 0.018 |
| 42-inch | 0.019 |
| 48-inch | 0.020 |
| 54-inch and larger | 0.021 |
| Spiral Ribbed Steel Pipe | 0.012 |
| **(3/4"x3/4"x7-1/2" Ribs)** | |

### 1.7.6 Culvert Design

Culverts were sized using the methodologies set forth in the Federal Highway Administration's HDS No. 5 and using the HY-8 computer program.

### 1.7.7 Detention Pond Design

Storm water detention ponds are being constructed to reduce post-development flows from the site to pre-development levels. The detention basins and outlet structures are sized to pass the peak runoff from a 100-year storm. The detention basins include an emergency spillway to pass flows which exceed the 100-year storm. Routing of design storms was performed using UDFCD software to meet Colorado storm water requirements, and results are included in the appendix.

#### 1.7.8 Storm Drain And Culvert Pipe

Storm drains and culverts are designed to withstand earth dead loads as well as H-20 or HS-20 highway live loads.

##### 1.7.8.1 Pipe Materials

Based on a minimum 25-year design service life, the following pipe materials were allowed.
Reinforced Concrete Pipe.
Reinforced Concrete Pipe.
Polyvinyl Chloride Pipe.
Corrugated Polyethylene Pipe.
Polyethylene Profile Wall Pipe.

##### 1.7.8.2 Pipe Joints

Non-watertight pipe joints were used since ground water was not present at the time soil borings were performed.

### 1.8 TRAFFIC SIGNAGE AND STRIPING

Traffic signs and striping conform to the Manual on Uniform Traffic Control Devices (MUTCD).

### 1.9 EROSION AND SEDIMENT CONTROL

The total area disturbed by construction was approximately 4.2 acres. An NPDES permit for storm water discharges from construction sites was required.

#### 1.9.1 Permanent Erosion And Sediment Controls

Permanent erosion and sediment controls included the following:

##### 1.9.1.1 Seeding

All areas disturbed by construction and not otherwise surfaced were to be seeded. Seeding of grass was to provide stabilization to the soil by holding the soil particles in place.

##### 1.9.1.2 Riprap Apron

Scour resulting from highly turbulent, rapidly decelerating flow is a common problem at conduit outlets. Riprap aprons were designed for erosion protection downstream of conduit and culvert outlets. The calculations included in the supporting Appendix titled “Riprap Apron Calculation Summary” displays all conditions considered for these designs and final outputs. These calculations and designs were created based on guidance referenced in the 2016 updated *Urban Storm Drainage Criteria Manual: Volume 2 Structures, Storage, and Recreation* document published by the Urban Drainage and Flood Control District.

### 1.9.2 Temporary Erosion And Sediment Controls

Temporary erosion and sediment controls such as silt fences, culvert inlet protection, drainage swales, check dams, etc. were shown in the sediment and erosion control plan. The contractor shall develop a Stormwater Pollution Prevention Plan to be prepared as part of the NPDES permit for stormwater discharges from construction sites.

## 1.10 ACTION ITEMS

### 1.10.1 Civil

Existing conditions of the culvert crossings for the perimeter road are unknown at the time of design. The plan was to design detention basins on each side of the facility and drain to the east.

Grading has not yet been designed. To reduce grading costs a retaining wall may be considered as an option.

## 1.11 SPECIFICATIONS

The following specifications will be included in the final design documents:

| | |
|---|---|
| UFGS 10 14 53 | Traffic Signage |
| UFGS 31 00 00 | Earthwork |
| UFGS 31 05 19 | Geotextile |
| UFGS 31 05 21 | Geogrid Soil Reinforcement |
| UFGS 31 11 00 | Clearing and Grubbing |
| UFGS 32 01 19 | Field Molded Sealants for Sealing Joints in Rigid Pavements |
| UFGS 32 05 33 | Landscape Establishment |
| UFGS 32 11 20 | Base Course for Rigid Paving |
| UFGS 32 11 23.23 | Base Course Drainage Layers |
| UFGS 32 13 13.06 | Portland Cement Concrete Pavement for Roads and Site Facilities |
| UFGS 32 15 00 | Aggregate Surface Course |
| UFGS 32 16 19 | Concrete Sidewalks |
| UFGS 32 17 23 | Pavement Markings |
| UFGS 32 31 13 | Chain Link Fences and Gates |
| UFGS 32 92 19 | Seeding |
| UFGS 32 93 00 | Exterior Plants |
| UFGS 33 40 00 | Storm Drainage |

## 2.2 GENERAL

This section discusses the water, wastewater, and industrial waste requirements to support the construction and operations of the Fire Station Support Facility. Utility construction will include; fire water line to service the fire suppression system and exterior fire protection, the domestic water service line; sanitary sewer service line, and an Industrial holding tank and industrial waste service line from the Fire Station building floor drain. Calculations supporting the sizing of water lines for domestic water and fire protection are included in the Appendix. Sanitary sewer calculations are also included in the Appendix.

## 2.3 DOMESTIC WATER

### 2.3.1 Existing Water System

#### 2.3.1.1 Water Source

Based on a review from the 2011 As-built drawings of the 47th BCT Water & Gas Infrastructure Project at Ft. Carson, there are two water main lines connected to the 500,000-gallon Elevated Water Storage tank. The installation's main water supply, a 12" line (located North of Gate 6, Building #9500) supplies water to the storage tank. The second water line is a 10" main distribution line (located south of Gate 6) that provides water to the installation. Both water lines run parallel to Wilderness Road. The 500,000-gallon Elevated Water Storage tank is supplied with water from two sources 1) a supply line from Cheyenne Mountain State Park across from Gate 1 and 2) a supply line from the intersection of Wilderness and Butts Roads. There is only one fire hydrant near Building #9500.

### 2.3.2 Domestic Water Service

The water demand for this facility required design considerations for both domestic use and fire protection. The new Fire Support Station facility peak instantaneous domestic water demand is estimated to be 91.2 gallons per minute (gpm) using the International Plumbing Code (IPC) Fixture Count Method. This flow also include allowance for two hose bibbs (wall hydrants) and an emergency eye wash/shower. The domestic water daily demand is also determined using the Building Population Method (in accordance with UFC 3-230-03). For a planned resident daily occupancy of 5 people and a daily demand of 125 gpd/capita, the approximate average daily water demand is 625 gal per day.

Calculations utilizing the Hazen-Williams equation showed that a 3-inch diameter service line will provide adequate water supply to the building. Velocity in the service line is estimated to be approximately 4.2 feet per second (fps) under maximum-use conditions. UFC 3-230-01 paragraph 4-1.2 states that velocity within the pipe shall not exceed 5 fps. Therefore, a 3-inch service line is adequate.

A 3-in gate valve and valve box is provided on the service line near the point of connection to the 10" water main loop. This gate valve will provide means to isolate the line should repairs be needed.

#### 2.3.2.1 Fire Protection Water

##### 2.3.2.1.1 Fire Flow Requirements for the Fire Station

The Fire Station Support Facility is protected by a wet pipe sprinkler system. The system shall be installed in accordance with NFPA 13. The Omaha District Fire Protection Engineer (FPE) calculated the fire protection water requirements in accordance with the most recent UFC 3-600-01 criteria. The required water flow for the fire sprinkler system is 650 gpm. The UFC requires a hose stream of 250 gpm. The water supply for the facility/site for fire protection will be 900 gpm. The duration time per UFC 3-600-01 for this water supply is 60 minutes. The residual pressure required at the base of the riser in the Fire Station is estimated at 47 psi for a 900 gpm flow. Per UFC, the fire flow for sprinklered facilities must be a minimum of 1,000 gpm at 20 psi.

A flow test was conducted by USACE Omaha personnel on 2 February 2021. Because there was only one fire hydrant, readings from the Guard House (Building #9500) and reading from the water tank level were recorded while flowing the hydrant. Measured test results at the fire Hydrant indicated a static pressure of 58 psi, a pitot pressure of 38 psi at flow of 1050 gpm. The flow test results of the existing static pressure, residual pressure, and flow capacity is used to determine if the existing utilities can support the fire flow requirements at the new facility. Based on the fire flow test data:

Pressure available at the water main at fire flow demand:

| | | |
|---|---|---|
| Fire Flow Demand | 650 | gpm |
| Fire Flow during flow test | 1050 | gpm |
| Static Pressure | 58 | psi |
| Test Residual Pressure | 49 | psi |

The calculated Residual Pressure available is 54psi.

Using the Hazen-Williams equation, the required diameter for water looped system line is calculated to be a minimum 10-inch line. The new 10-in water line is looped around the new facility to allow flow to come from two directions into the service to provide at least 50 percent of the required fire flow in case of a single break as required per UFC 3-600-01. This looped water line is combined to deliver both domestic and fire protection flows.

An 8-in water line will provide the required water flow of 650 gpm for the fire sprinkler system of the building. The utility plan shows an 8-inch fire service line entering the facility through the south east face of the building. A Post Indicator Valve (PIV) is shown outside the building approximately 140 feet from the facility. The 8-in fire water line will be connected to the 10” water main loop with a 10”x10”x8” mechanical joint tee. The velocity in the pipe due to the fire protection flow is calculated to be approximately 5 feet per second (fps). This meets the USACE Omaha design practice to limit the velocity to 10 fps, with a preferred velocity below 8 fps.

Per UFC 3-600-01 an exterior fire hydrant must be located within 350 feet of all parts of the facility. The l utility plan includes two new fire hydrants to be installed near the south and west face of the building. These hydrants are placed so that all sides of the building can be reached within 350 feet of the hydrant.

## 2.4 WASTEWATER COLLECTION

### 2.4.1 Domestic Wastewater

Based on As-built drawings of the Sanitary Sewer at Wilderness Road Project at Ft. Carson, and survey confirmation, there are two existing manholes near the project area. One manhole (MH) is located north of the Guard House (Building #9500) and the second MH is located approximately 320 feet west from the first MH.

The Manning equation was used to calculate the minimum required diameter for the facility’s wastewater collection line. The estimated peak discharge was calculated using two methods: (1) the Building Population Method and (2) the IPC Fixture Count Method. The peak discharge is estimated to be the larger of the two estimated discharges, 44 gallons per minute (gpm) found using the IPC Fixture Count Method. The Manning equation found that a 4-inch diameter line and an 8-inch are capable of handling this estimated peak discharge.

The utility plan shows the 4-inch sanitary sewer connection discharging from the north east face of the facility into a manhole and a new 8-inch the gravity sanitary sewer line to be connected to the existing MH located north of Wilderness Road. The san sewer lines diameter was calculated

assuming a pipe material friction factor (n) of 0.013 and a minimum slope (S) required to meet a minimum flow velocity of 2.5 feet per second (fps) as required by UFC 3-240-01. See the calculations for an overview of flows, velocities, and percent full values for the flow conditions.

## 2.5 INDUSTRIAL WASTEWATER

The industrial waste from the Fire Station facility flow is estimated to be generated from an emergency shower and eyewash and from the waste flow from washing the fire trucks. The industrial waste from the Fire Station facility flow is estimated about 30 gpm. All industrial waste flow from Fire Station trench drains located at the Apparatus bay, is collected by three 4” drain lines which gravity flows to a 6” industrial waste line. The industrial waste will be discharged to a 500-gallon industrial holding tank located at the north west corner of the facility by the parking lot, for easy access to the a waste hauler.

### 2.5.1 Tank Alarms

The industrial tank will be provided with audible alarms and a warning light. The alarms will be set to signal at the "time-to-pump" and "exceeding reserve storage volume" levels. The audible and visual alarm enunciators must be located outside the facility, with battery power or electrical power as available. The audible alarm shall be manually turn off by the user.

# 3 ARCHITECTURAL

## 3.1 GENERAL PARAMETERS

### 3.1.1 Design Criteria.

The following criteria are applied to the design of the project:

**Unified Facilities Criteria (UFC) – most current version published UNO**

| | |
|---|---|
| UFC 1-200-01 | DoD Building Code |
| UFC 1-200-02 | HPSB Requirements |
| UFC 3-101-01 | Architecture |
| UFC 3-110-03 | Roofing |
| UFC 3-600-01 | Fire Protection Engineering for Facilities |
| UFC 4-010-01 | DoD Minimum ATFP Standards for Buildings |
| UFC 4-730-10 | Fire Stations |

**Code of Federal Regulations (CFR)**

| | |
|---|---|
| 10 CRF 430 | Energy Conservation Program for Consumer Products. |
| 28 CFR 36 | Nondiscrimination by Public Accommodations and in Commercial Facilities; Final Rule; Department of Justice |
| 29 CFR 1910 | Occupational Safety and Health Standards; Occupational Safety and Health Administration; Current Edition. |
| 29 CFR 1926 | Safety and Health Regulations for Construction; Occupational Safety and Health Administration; Current Edition. |
| 36 CFR 1191 | Americans with Disabilities Act (ADA) Accessibility Guidelines for Buildings and Facilities; Architectural Barriers Act (ABA) Accessibility Guidelines. Appendices C and D, Architectural Barriers Act, (ABA). |

**Building and Life Safety Codes**

| | |
|---|---|
| ICC (IBC) | International Building Code; 2018 |
| NFPA 101 | Life Safety Code; 2021 |
| IWUIC | International Wildland-Urban Interface Code; 2018 |

**Industry Standards**

| | |
|---|---|
| ASHRAE 90.1 | Energy Standard for Buildings; except Low-Rise Residential Buildings (2013) |
| ASHRAE 189.1 | Standard for the Design of High-Performance Green Buildings; except Low-Rise Residential Buildings (2014) |

### 3.1.2 **Purposes and Function.**

The project is required for down range firefighting support at Ft Carson, CO. The scope is to design a small, non-standard, fire station to support increased training requirements and new training ranges. This project will include an apparatus bay for four fire trucks and work room; a residential/living area to include five dorm/sleeping rooms, a kitchen, dayroom, fitness area, unisex restroom/showers, storage space and a crew open office for basic operations and training. The building will also provide back-up emergency power for the apparatus bay. The project will include a heated storage building for storing firefighting foam and other supplies. The entirety of the project will include doors, lighting, communication functions, and all associated equipment. Air conditioning is required.

In addition to the primary facility scope, a proprietary station alert system, and required quantities of paving due to a minimum turning radius of 80 feet for the crash truck, and specific utility and power routing.

The facility category code for this project implies that this is an Army Standard facility, however, the smallest standard that could apply is approximately 2.5 times the area needed for this project. With direct consultation with the applicable Center of Standardization (COS), it was recommended that the standard apply to fire station standard areas to include the dorm rooms, kitchen/day room, CPT office, etc. To the extent possible, the maximum allowable areas have been applied to this project.

The total allowable square footage for this project is 9,250 square feet for the fire station and 680 square feet for the storage building as defined by the revised DD form 1391 and UFC 4-730-10.

### 3.1.3 **Desired Image and Aesthetics.**

#### 3.1.3.1 **Exterior.**

The exterior aesthetics of the fire station were originally inspired by the aesthetics of the historical area at the Turkey Creek Ranch where this project was originally intended to go. The Fort Carson Directorate of Public Works (DPW) and the Fort Carson Fire Department liked the design, so the decision was made to keep the exterior aesthetics mostly the same despite relocating the project to a new site outside of the Turkey Creek Ranch area. The exterior shape and scale was heavily considered with respect to the adjacent historical context. Since this site was non-relatable to any other structures in the area, it was important to give homage to the past of Fort Carson. The wainscot of the building is a ledge stone veneer. The colors represented in this selection of stone reflects and integrates the natural soil and stone of the area. The choice of white vertical metal panels is reminiscent of the materials used at the Turkey Creek Ranch. The conceptual massing of the new fire station was derived from the marriage of the elevation of the Transverse Frame Barn but divided into two bays at different ridge elevations. A contemporary flair was applied to the roof paneling system with a copper finish and charcoal grey doors and dark bronze anodized windows. The storage building that is adjacent to the fire station will have the same exterior materials as the fire house for continuity, excluding the ledgestone wainscot. The windows on the fire station are operable so the users can naturally ventilate their rooms and have direct views to natural habit. The fire station folding doors are filled with glass panels so that light penetrates throughout the apparatus bay.

#### 3.1.3.2 **Interior.**

The space planning concept was to give a high-end residential feeling through the fire station facility. The unisex restroom/showers give the users the sense of privacy that they would have in

their own home. One of the two restroom is fully ABA compliant. The dorm rooms have adequate space with high ceilings to give the sense of a larger living area. The windows within the dorm rooms are operable to allow fresh ventilation and daylighting into the rooms. Spaces are organized within the fire support station to keep all dorm rooms furthest away from the apparatus bay and closest to the kitchen. The kitchen is used as the heart of the fire station. The day room and open office are accessed by proceeding down a central corridor and through the kitchen. The fitness room is located near the front entrance vestibule and is acoustically separated from the rest of the spaces through STC-50 rated walls and interstitial spaces that are not acoustically sensitive. The facility includes an entry vestibule, five dorms, a captain's office, day/training room, multiple storage rooms, a large custom kitchen, unisex restroom and shower rooms, fitness area, laundry room, mechanical, electrical, and telecommunications rooms. The apparatus bay is a completely open space for support vehicles with a work room inside.

### 3.1.4 **Building Occupancy (non-code-based).**

Civilian fire-fighting personnel will utilize this facility. Most of the facility will be utilized 24/7/365.

The building supports the main fire station's mission at Fort Carson as a forward operations facility with direct access to support the wide range of combat units training at the installation. This includes (but is not limited to): a light infantry brigade, a heavy maneuver brigade, a Stryker brigade, a combat aviation brigade, a sustainment brigade as well as a National Guard and army reserve training unit. A full FTE/occupant analysis is included in the sustainability documentation in the appendices. Summary figures are as follows:

Total Facility FTE Equivalent = 11 FTEs

Regular (Average) Building Population = 11 PN

Maximum Visitor Load = 3 PN

Average Visitor Load = 14 PN

SIMULTANEOUS ALERT AND OPERATIONS STAFF SHIFT CHANGE:
PEAK BUILDING USERS = Peak Transient Load + Total FTE Load
PEAK BUILDING USERS = 3 Transients/Visitors + 11 = 14 PN

ALERT OR OPERATIONS FACILITY STAFF SHIFT CHANGE:
DAILY AVERAGE USERS = Daily Average Visitor Load + Regular Building Load
DAILY AVERAGE USERS = 0 Transients/Visitors + 11 PN = 11 PN

### 3.1.5 **Target Design Life.**

The facility is to have a 25-year useful design life before re-use/re-purpose, and a 40-year building replacement life in accordance with the UFC 1-200-02.

### 3.1.6 **Category of Construction.**

The facility is permanent construction.

## 3.2 FUNCTIONAL AND TECHNICAL REQUIREMENTS.

### 3.2.1 **Facility Equipment and Accessories.**

This facility contains apparatus bay, shops, office, dorms, kitchen/living area, fitness room, administrative spaces, associated support functions, and a day room.

### 3.2.2 Occupational Safety and Health

### 3.2.3 Handicapped Accessibility, and Provision of Blind Vending Areas rated by State Agencies

The fire station facility will be compliant with ABA.

### 3.2.4 Energy Conservation including solar energy applications and energy budget goals

Energy conservation will pursue compliance with the requirements in UFC 1-200-01. This project will not be undergoing third party certification as the square footage is below the threshold requiring it in UFC 1-200-01.

### 3.2.5 Sound and Vibration Control

Sound and vibration control has been designed by installing sound transmission class walls at different ratings to keep unwelcome and disruptive noise from public spaces infiltrating into private/semi-private spaces. Dorm Rooms and the Fitness Room have STC 50 rated walls.

### 3.2.6 Interior Parking and Service Areas

Parking and services areas are not included within the facility.

### 3.2.7 Physical security: lock and keying, intrusion detection, alarms, restricted access areas, interior guard/canine support, and ties to local authorities.

Physical security is provided by electrical magnetic strikes and hook-ups to later install CAC readers and security cameras. The project includes standard keyed locks with 5 button mechanical lock overrides.

### 3.2.8 Justification for Selection of Exterior and Interior Finishes and Materials

The selection of the exterior and interior materials was originally based on the Turkey Creek Ranch area's facilities and approved by Ft. Carson's DPW for incorporation at the new site.

### 3.2.9 Moisture Vapor Control

The insulated metal roof and wall panels serve as the air/vapor barrier, except at the ledgestone wainscot. A adhered air/moisture barrier membrane is applied behind the insulation at the wainscot and lapped up behind the insulated metal wall panel to provide a continuous barrier. The air/vapor barrier envelope will not be pressure tested as the building size falls below the threshold for testing, but the installation of the continuous envelope is required to be field inspected.

### 3.2.10 Lessons Learned Incorporated into the Design

## 3.3 DESIGN OBJECTIVES AND PROVISIONS

### 3.3.1 Adaptation of the building to the size, shape, and orientation of the site to include benefit from natural warming and cooling effects afforded by the site.

The building size was adapted from UFC 3-600-01 and the DD 1391 for a smaller sized fire station. The orientation of the building was to maximize daylighting and minimize direct solar heat gain from the southern and western exposure.

3.3.2 **Type of construction materials, architectural systems, and finishes to include basis for selection.**

Construction materials are to include:
PEMB – Pre-engineered Metal Building – cost efficient
Insulated metal wall panels – Ascot White, to match colors from Turkey Creek Ranch, providing continuous insulation/
Insulated metal roof panels – standing seam -Copper Penny finish to reflect direct solar heat gain and providing continuous insulation
Wainscot – Ledge stone – Blue Spruce Ledge – representative of the soil and stone around the area.

3.3.3 **Economy of building construction, operation, and maintenance: life cycle cost effectiveness.**

This design analysis will provide further information as the design progresses.

## 3.4 CALCULATIONS

3.4.1 **Net room areas, occupant capacity and gross building areas.**

| | | |
|---|---|---|
| 00 | VESTIBULE | 49 SF |
| 01 | STORAGE | 23 SF |
| 02 | DORM | 122 SF |
| 03 | DORM | 121 SF |
| 04 | DORM | 124 SF |
| 05 | DORM | 125 SF |

| 24 | CORRIDOR | 113 SF |
| 25 | PATIO | 212 SF |
| 26 | STORAGE BLDG | 512 SF |

**TOTAL SQUARE FOOTAGE: 7,589 SF + 512 SF = 8,101**
NOTE: TOTAL DD1391 ALLOWABLE SCOPE IS 9,250 SF FOR THE FIRE STATION AND 690 SF FOR THE STORAGE BUILDING.

GROSS BLDG AREA = 8,359 SQFT / FULL SCOPE

PATIO CANOPY = 139 SQFT / HALF SCOPE

FRONT CANOPY = 105 SQFT/ HALF SCOPE

STORAGE BUILDING = 600 SQFT/ FULL SCOPE

**TOTAL = 9,203 SQFT**

### 3.4.2 U values for each wall, window, door, or roof type studied or selected.

Exterior Aluminum Windows: U-0.27

Exterior steel doors: U-0.48

Overhead Coiling Door: R value of R-7 (U-0.14)

Overhead Sectional Door: U-0.27

Four fold doors: U-0.27

Insulated Metal Wall Panels: R-21 (U-0.05)

Insulated Metal Roof Panels: R-30 (U-0.03)

Insulated Wainscot (2” Rigid Insulation + 1 1/2” Spray Foam): R-11.4 (U-0.09) + R-9 (U-0.11)

Foundation insulation: R-10 (U-0.1)

### 3.4.3 Ratio of exterior window and room area, if applicable.

This design analysis will provide further information as the design progresses.

### 3.4.4 Gutter and downspout calculations.

Low Pitch Roof Bay- Large Roof Area Drained
Area: 2,562 SF
Gutter Feet: 79 ft
Design Rainfall (inches): 5.7in
Gutter Length Serving Single DS (feet): 39.5 ft
M (Depth to width ratio): 0.75
Sloped roof gutters (inches): 0.125
Min. Gutter Width: 4.5” X 5.5” (rectangular)
Number of Downspouts: 2
Min. Area per downspout: 6.32 in^2
Downspout width (inches): 4 in
Downspout depth (inches): 3 in

## 3.5 COORDINATION WITH INSTALLATION OR OUTSIDE AGENCIES

### 3.5.1 Government furnished equipment.

**ADMIN FURNITURE – FF&E:**

Accessories:
- Trash Receptacle, small
- Trash Receptacle, large
- Trash Half-round, tall

Desks/Tables:
- Desk, L-Shaped
- Work Table
- Dining table
- End table
- TV side table

Storage:
- Lateral File – 5 drawer
- Storage Cabinet
- Lower storage credenza
- Bookcase
- Heavy duty shelving
- Flammable storage cabinet

Chairs:
- Chair, recliner
- Chair, dining stools
- Chair, desk
- Chair, side

Miscellaneous:
- Desk Lamp
- Bulletin board
- Magnetic White Board – 8’-0”

**UEP FURNITURE – FF&E**

Dorm Room:
- Captain’s bed
- Night stand
- Night stand lamp
- Desk
- Desk lamp
- Wardrobe
- Mattress
- Box spring

Equipment:
- Refrigerator
- Microwave
- Stackable washer
- Stackable dryer

**CFCI – EQUIPMENT**

- Dishwasher
- Ice Machine

Hood
Double Oven
Stovetop

**GFGI – EQUIPMENT**

Extractor
Air Compressor
Hose Storage Rack
Expander
Hydraulic Hose Coupler
High Pressure Washer
Workbench

**USER RESPONSIBILITY:**

Fitness Equipment
Copier
TV – 42” Flat Screen
TV – 67” Flat Screen
Outdoor Furniture

3.5.2 **Operations and maintenance support.**

Manufacturer’s manuals will be provided to Ft. Carson’s Resident Office (DPW).

## 3.6 LESSONS LEARNED

None

## 3.7 ACTION ITEMS

None

# 4 INTERIOR DESIGN

## 4.1 DESIGN OBJECTIVE

The intent of the Interior Design is to provide aesthetically pleasing, comfortable, functional and easily maintainable working and living space for the occupants. The Interior Design includes coordination of the interior finishes and materials, including selection of color, texture, and pattern, in addition to the preparation of building finish specifications, which includes window treatment and interior signage.

## 4.2 FINISHES AND COLOR SCHEME

The interior finishes will be selected to simplify maintenance and operations, maximize flexibility and assure long-term appearance retention. Color, texture and pattern within the facility create continuity and interest, are visually pleasing and easily maintainable.

### 4.2.1 INTERIOR COLORS.

The interior color theme will be carried throughout the facility, but with slight changes to help differentiate between various functional areas within the facility. These variances will be seen in subtle color and pattern changes within the facility.

Color and pattern will be introduced in carpet, porcelain tile, athletic rubber flooring, protective wall covering wainscot, solid surface countertops and plastic laminate. The furniture finishes will help hide soiling and provide visual interest.

### 4.2.2 EXTERIOR COLORS.

Reference the Architectural DA for exterior finish and color information.

## 4.3 FURNITURE, FIXTURES AND EQUIPMENT (FF&E)

A furniture footprint has been developed utilizing generic furniture sizes and is provided for space planning purposes. The furniture requirements will be coordinated with user and DPW.
Equipment such as printers, copiers, outdoor furniture and fitness equipment are Government Furnished/Government Installed (GFGI) and not in contract.
The furniture package will be procured by USACE Huntsville Furnishings Program (HNC).

# 5 STRUCTRAL

## 5.1 PROJECT DESCRIPTION

The Fire Station at Turkey Creek Recreation Area consists of a Fire Station building and an accompanying Pump House. The Fire Station includes an Apparatus Bay and an Administration/Residential Area.

### 5.1.1 Fire Station

The Fire Station is framed as a single-story pre-engineered metal building, consisting of a high bay for the Apparatus Bay, and a low bay for the Administration and Residential Areas. The high bay is approximately 60’ x 60’, and the whole building is approximately 60’ x 113’. The roof slope is 4 on 12.

#### 5.1.1.1 Framing

The high bay incorporates two interior gabled rigid frames with tapered columns, and two conventional end wall frames with X-bracing in the center bay or, alternatively, in both end bays, where the center bay brace would obstruct doorways. Frames are spaced approximately 20 feet on center, with final alignment being set by the door frame requirements. The eave height of the high bay is approximately 22’-6”. The low bay consists of three gabled rigid frames with straight columns, spaced at approximately 25 feet on center. The exterior end wall is framed with a rigid frame because conventional X-bracing would interfere with windows. The eave height of the low bay is approximately 12’-0”. Roof purlins are assumed to be 8-inch deep light gage Z-sections, and wall girts are assumed to be 8-inch light gage channels. The girt configuration is “inset”, with a one-inch offset of the girt line from the exterior face of the frame columns. Stability of the framing system in the side walls is provided by one bay of rigid portal frames each, for both the high and low bays. There is no structural roof diaphragm; the roof is stabilized by X-bracing in both the high and low bays at the portal frame locations.

#### 5.1.1.2 Foundation

The foundation for the Fire Station building consists of continuous cast in place concrete foundation walls and strip footings beneath all perimeter exterior walls. Pre-engineered metal building’s columns are supported on concrete pedestals with spread footings.

#### 5.1.1.3 Floor Slabs

The floor slab for the Apparatus Bay portion of the building is sized to accommodate the wheel loads from the emergency vehicles which will be operated out of the station. The Administration/Residential Area floor slab is a uniform five inches thick; governed by the requirements of the mechanical room in this part of the building. A 6” thick layer of capillary water barrier material and vapor barrier material is provided bellow all slabs. The slabs contain a minimum amount of steel reinforcement to control temperature and shrinkage cracking. Slab contraction joints are provided to reduce uncontrolled cracking of the slabs.

### 5.1.2 Fire Pump House

The Pump House contains underground storage reservoirs for both the fire suppression system and the domestic water supply. The building’s superstructure is a pre-engineered metal building, with overall dimensions approximately 30’ x 52’. The roof slope is 4 on 12, matching that of the

Fire Station.

1.1.1.1 Framing

The framing of the Pump house consists of two interior gabled rigid frames with tapered columns, and two conventional end wall frames with X-bracing. The frame spacing is approximately 20 feet, and the eave height matches that of the low bay of the Fire Station at 12'-0". Roof purlins are assumed to be 8-inch deep light gage Z-sections, and wall girts are assumed to be 8-inch light gage channels. The girt configuration is "inset", matching the Fire Station, with a one inch offset of the girt line from the exterior face of the frame columns. Stability of the framing system in the side walls is provided by conventional X-bracing on the back side of the building, and by a rigid portal frame on the front side, where interference with overhead service doors prevents the use of X-bracing.

5.1.2.1 **Foundation**

The Fire Pump House superstructure bears on concrete foundation walls, 12 inches in thickness, which form the water storage tank walls. The floor is a structural cast-in-place slab, approximately 12 inches in thickness, which also serves as the top of the reservoirs and the mounting platform for water pumps. The reservoir area below the building incorporates the entire building floor plan, and extends to a depth of 16'-6" below the slab. The foundation walls are designed as earth-retaining walls, to support lateral earth pressures on the outside of the reservoir tanks. The slab forming the bottom of the storage tanks will make a single transition from the 16'-6" depth below the ground floor slab in the areas directly below pump impellors, to 12'-0" in other reservoir areas.

## 5.2 DESIGN CRITERIA

The following references were used in preparation of the structural design:

UFC 3-301-01 Structural Engineering
UFC 3-310-04 Seismic Design of Buildings

## 5.3 DESIGN LOADS

### 5.3.1 Roof Snow and Live Loads

Ground Snow Load: 15 psf
Exposure factor: Ce = 1.0
Thermal factor: Ct = 1.0 (Heated structures)
Importance Factor: I = 1.2 (Essential Facility)
Snow drifts and sliding snow loads included as required
Rain on snow surcharge does not apply because of the roof slope < W/50 degrees.
Minimum Roof live load: 20 psf- construction and maintenance.

Frost Penetration: 38 in (UFC 3-301-01)

### 5.3.2 Wind Loads

Wind pressure are computed in accordance with ASCE 7-10 and UFC 3-310-01 using the following parameters:
Basic wind speed: V = 133 mph (Risk Category IV)
Exposure Category: C
Topographic: Kzt = 1.0
Gust Factor: G= 0.85
Wind Directionality Factor: Kd = 0.85
Internal Pressure Coefficients: 0.55 – High bay area of Fire Station and Pump House
0.18 – Low bay area of Fire Station

### 5.3.3 Seismic Loads

Seismic loads are computed in accordance with ASCE 7-10 and UFC 3-310-01. Seismic parameters include:
Short Period Spectral Response Acceleration: Ss = 0.181g
1.0 Second Spectral Response Acceleration: $S_1$ = 0.061g

Design earthquake spectral response acceleration parameter at short period $S_{ds}$ = 0.193 g
Design earthquake spectral response acceleration parameter at 1 s period $S_{d1}$ = 0.098 g
Soil Class: Class D
Importance Factor: I = 1.5, Essential Facility.
Seismic Design Category: Class C
Response Factor for Ordinary Steel Moment Frames: R = 3.5

### 5.3.4 Floor Live Loads

Design loading for Fire Station and Fire Pump House to be determined on the basis of vehicle and equipment loading.

### 5.3.5 Foundation Design Criteria

The parameters for the foundation design according to the final soil report
Preliminary allowable soil bearing capacity (FS 2) = 2500 psf assumed for all structures.
The minimum footing depth is 3.5 feet

## 5.4 MATERIAL STRENGTHS

Structural materials strengths used for design:

### 5.4.1 Cast-in-Place Concrete

All work: Normal weight concrete with specified minimum compressive strength, f'c = 4500psi at 28 days
Reinforcing Steel: Fy = 60 ks.

### 5.4.2 Structural Steel:

Channels, angles, and plates: Fy = 36ksi, ASTM A36
Rolled W-shapes: Fy = 50ksi, ASTM A992 or A572

Tube shapes: Fy = 46ksi, ASTM A500, Grade B.

# 6 MECHANICAL

## 6.2 GENERAL

The purpose of this project is to design and build a new Fire Station Support Building located at Gate 6, Fort Carson, CO. Various mechanical systems will be provided to condition the different areas of the facility. Plumbing systems will be provided, including domestic water supply, domestic water heating, drain, waste and vent. The facility consists of sleeping rooms and living areas as well as a Apparatus Bay to house fire fighting apparatuses and equipment maintenance areas. Descriptions of the mechanical systems are listed below for the different space functions.

## 6.3 DESIGN REQUIREMENTS

### 6.3.1 Design Temperatures

Winter:

| | |
|---|---|
| Outside: | 4 degrees F. |
| Inside: | 68 degrees F. (Occupied Space, Truck bay)<br>55 degrees F. (Mechanical/ Electrical Room)<br>60 degrees F. (Vestibule) |

Summer:

| | |
|---|---|
| Outside: | 88 degrees F. DB (1 percent)<br>63 degrees F. MCWB (1 percent) |
| Inside: | 78 degrees F. DB (Occupied Space)<br>80 degrees F. DB (Mechanical / Electrical Room) |

### 6.3.2 Occupancy

Building occupancy will be considered to be 24 hours per day, 7 days a week, due to the emergency response requirements of the occupants. Rooms with predictable occupancy (such as kitchen) will be served with an HVAC system using a time of day schedule with overrides based on occupancy sensors. Other areas may use a similar control method with different override lengths or a different method to sense occupancy.

### 6.3.3 "U" Values

See architectural sheets.

### 6.3.4 Ventilation Rates (based on ASHRAE62.1-2010)

| | |
|---|---|
| Occupied Areas | 5 cfm/person + 0.06 CFM/SQ FT |
| Rest Rooms/Showers | 25 CFM per fixture (Exhaust) |
| Janitor Closet | 1 CFM/SQ FT (Exhaust) |

| | |
|---|---|
| Kitchen | 350 CFM (Exhaust) |
| Truck bay | 0.06 CFM/SQ FT + 10 CFM/person |

#### 6.3.5 Internal Heat

##### 6.3.5.1 Electrical Equipment

Cooling Load calculations will take into account heat generated from anticipated equipment, lighting and misc. loads. Loads for electrical equipment will be based on conservative heat release values.

## 6.4 HVAC SYSTEMS

### 6.4.1 HVAC Equipment Selection

#### 6.4.1.1 Main Building Occupied Spaces

Due to the need for individual temperature control in many of the rooms in the main building, a central air handling unit would not be appropriate to meet the heating and cooling needs of this facility. This is due to the potential need for simultaneous heating and cooling loads within different rooms of the building and the relatively low energy efficiency of a central air handling unit providing heating and cooling simultaneously for such small zones. Thus, it was decided that heating and cooling for these spaces will be accomplished using 4-pipe fan coil units installed in the rooms. The chilled and hot water will be provided by an air-cooled chiller located outside the building. Natural gas fired hot water boilers will provide heating water for the hydronic system. Gas was chosen over electricity for the boiler fuel source since gas was chosen to provide fuel for the kitchen stovetop so a gas service line was already being implemented. A variable refrigerant flow (VRF) system was initially considered to meet the heating and cooling demand for the occupied areas of the building due to its proficiency at providing simultaneous heating and cooling of low load zones such as those present in the fire proposed fire station. However, at this time, no VRF systems have been identified that meet the UFC 3-410-01 requirement that the control systems of the VRF must be compatible with the open-source system used at Fort Carson, thus fan coil units were ultimately chosen.

#### 6.4.1.2 Kitchen

Based on consultation with the district fire protection engineer, the kitchen cooking appliances were deemed to be a residential cooking application. Based on this designation, the IRC (International Residential Code) was looked to for guidance on proper range hood exhaust requirements over the IMC (International Mechanical Code) as the IMC primarily discusses commercial equipment applications. The IRC states that where residential cooking appliances are installed, an exhaust rate of at least 100 cfm is required. Based on the size of the kitchen within the fire support facility an exhaust rate of 350 cfm was used.

#### 6.4.1.3 Apparatus Bay and Workroom

The Apparatus Bay will be provided with overhead infrared heating system to handle the heating requirements of the bay. Infrared heating was decided upon because it allows efficient heating of large open spaces such as those seen in the Apparatus Bay. Additionally, since fire-fighting apparatuses will be housed within the Apparatus Bay, a higher ventilation rate will be required and that combined with the large doors that the apparatuses enter through, would cause the operation of any heating system directly heating the space air to be very costly due to the large amounts of outside air constantly entering the zone. The bays will also be provided with fire

apparatus vehicle exhaust systems to allow for direct exhaust of all vehicle fumes to the outside. ERVs will be used to temper the outside air used to ventilate the apparatus bay. Ventilation will also be used during the summer months to prevent excessive heat build-up in the apparatus bay. A compressed air system will also be added to service the Apparatus Bay with self-retracting lines installed at each vehicle bay and workroom.

#### 6.4.1.4 Mechanical Room

Hydronic unit heaters will be provided to keep the spaces above 55 degrees F to. The space will be ventilated when required to prevent heat build-up from equipment operation.

#### 6.4.1.5 Electrical Room

A mini-split heat pump unit will be used to maintain the space between 68 degrees F and 74 degrees F. The fire alarm control panel is located in the Electrical room and requires a conditioned space.

#### 6.4.1.6 Vestibule

A hydronic unit heater will be provided to heat this area to 60 degrees F.

#### 6.4.1.7 Storage Shed

An electric unit heater will be provided to heat this area to 50 degrees F. The space will be ventilated when required to prevent heat build-up.

### 6.4.2 Environmental Control

#### 6.4.2.1 Temperature Controls

Heating and air conditioning for all spaces in the building and systems will be controlled through the use of direct digital control (DDC) system. Space temperature sensors will be provided in various locations throughout the facility. Each Fan Coil unit will be provided with a dedicated temperature sensor providing flexible and independent space temperature controllability.

## 6.5 PLUMBING REQUIREMENTS

### 6.5.1 General Requirements:

Design will provide the Fire Support Station with a new fully functional plumbing system that complies with the International Plumbing Code (IPC - 2018) and APPLICABLE CRITERIA.

### 6.5.2 General Description:

Plumbing work will consist of providing floor drains, hydrants, plumbing fixtures, fixture trim, all required waste, vent, and domestic water piping systems to a point five feet outside of the building perimeter.

### 6.5.3 Sanitary Sewer and Industrial Waste Systems:

The sanitary sewer will drain by gravity to the site sanitary system. The source for designing and sizing the sanitary system is the 2018 International Plumbing Code. The industrial waste system will consist of a trench drain and collection piping system for draining of equipment and bay area wash downs.

Industrial Waste is not available near the project site. A new industrial waste tank is currently sized based upon a 500 gallon volume of storage.

### 6.5.4 Domestic Water Piping System:

Building domestic water will be a 3" new service line to the building. An approved backflow preventer will be provided on the domestic water supply to the building. Water piping will be sized so that velocities will not exceed 8 fps. Water hammer arrestors are provided at the end of all piping risers with quick closing valves. All major branches will have isolation valves to facilitate maintenance. Servicing stops and isolation valves will be provided for water connection for all plumbing fixtures.

### 6.5.5 Water Meter:

Domestic water supply to the building will be provided with a water meter located inside the building. Meters will be provided with isolation valves upstream and downstream of the meter and with a building piping drain valve downstream of the meter. The meter will provide input to the installation wide EMCS.

### 6.5.6 Backflow Preventer:

All backflow preventers will be installed for accessibility and will comply with the requirements of the International Building Code and International Plumbing Code. State licensed plumbers will be required to install and/or test backflow preventers and cross connections devices.

### 6.5.7 Hot and Cold Water:

Design provides domestic hot and cold water to various plumbing fixtures.

### 6.5.8 Water Heating System:

Designed in accordance with American Society of Heating, Refrigerating and Air conditioning Engineers (ASHRAE) Handbook- HVAC Applications - 2015, Chapter 50, "Service Water Heating"; and in accordance with ASHRAE Standard 90.1, "Energy Efficient Design of New Buildings Except Low-Rise Residential Buildings". Size hot water system and set water heater (WH) storage temperature set point for no less than 140 degrees F to limit the potential for growth of Legionella pneumophila. Provide a hot water and cold water blending, tempering valve immediately downstream of the hot water storage tank to provide anti-scalding protection. Provide a balanced-pressure type tempering valve. Set the blending valve to deliver 110 degrees F water to the fixtures.

Domestic hot water recirculating pump will be provided for the domestic hot water. Pump sizing will be in accordance with ASHRAE Handbook- HVAC Applications - 2015, Chapter 50, "Service Water Heating". The system will continually circulate domestic hot water in order to insure that domestic hot water is available at each fixture with only a minimal time delay. All domestic hot water fixtures will be connected to a domestic hot water recirculation system. The domestic hot water recirculating pumps will be bronze fitted. Automatic control will be provided on domestic hot water circulation pumps to permit operation only during periods of occupancy plus thirty (30) minutes prior. The Building Automation System will be used to limit pump operation to periods when recirculation is required to maintain temperature of water in pipes.

### 6.5.9 Plumbing Fixtures:

Plumbing fixtures and trim will be commercial grade by domestic manufacturers. Fixtures and trim provisions will comply with the Americans with Disabilities Act (ADA). All trim will be stainless steel or chrome-plated brass. Water closets will be vitreous china. Lavatories will be integral to countertop. Refer to Specification Section 09 06 00, "Schedules for Finishes" for material and color. Water closets will be floor mounted water closets with battery operated flush valves that average 1.28 gallons per flush. Lavatories will have battery operated faucets with cold and hot water supplies and thermostatic mixing valves with high-temperature limit set at 105°F and .5 gpm aerator. Maximum flow rate for lavatories will not exceed 0.5 gpm. Sinks will have hot and cold water supplies and thermostatic mixing valves with high temperature limit set at 105°F. Maximum flow rate for sinks will not exceed 1.5 gpm. Shower will have a maximum flow rate of 1.5 gpm. Electric water cooler will be wall mounted, stainless steel, unfiltered with bottle filler. Electric water cooler will be provided with a dedicated ½" DCW pipe for user provided reverse osmosis system. Wash sink will be 16 gauge stainless steel with 8" swing spout faucet.

#### 6.5.10 **Emergency Shower/Eyewash:**

An Emergency Shower/Eyewash will be provided where industrial work using chemicals of any type, use of solvents and use or handling of oils/fuels occur. The apparatus bay currently has only one emergency shower/eyewash station required.

#### 6.5.11 **Floor Drains:**

Floor drains with 6" round, nickel bronze grates will be provided in each restroom with trap primers. Floor drains for mechanical rooms will be similar with 6" round heavy duty grates with deep seal trap. Floor drains will be provided with p-traps. A floor drain will be provided near all items requiring condensate removal.

#### 6.5.12 **Hose Bibbs, Wall Hydrants and Freeze proof Hose Bibbs:**

Hose Bibbs will be located in the Mechanical room and freeze proof hose bibbs with key access will be provided in the building exterior wall. A Wall Hydrant with a 1 ½" national standard hose thread fitting will be provide for in the apparatus bay for filling fire trucks.

### 6.6 GENERAL PIPING REQUIREMENTS

The following items apply to all piping in the building:

a. All piping and equipment located in finished areas of the building will be concealed or furred-in; exposed piping and equipment is only allowed in utility, equipment, storage, and other rooms of this nature. Exposed piping will be allowed in areas where there is a painted exposed structure ceiling. In areas where the ceiling is not painted exposed structure, exposed piping will not be allowed.

b. All pipe and equipment supports and hangers will be coordinated with the roof design to avoid overloading of any of the structural elements.

c. Piping and supports will not interfere with equipment maintenance access.

d. All condensate drains will be indirectly connected to the sanitary sewer system.

e. Exterior piping below grade will include provision for draining.

f. Domestic and service water systems will be flushed and chemically cleaned prior to

final fill.

Domestic and service water systems will be flushed and chemically cleaned prior to final fill.

## Definitions

LSC – Life Safety Code, NFPA 101
IBC – International Building Code

## 7.2 FIRE STATION SUPPORT FACILITY

### 7.2.1 OVERALL BUILDING DESCRIPTION

a. One Building.

b. Multiple Occupancies

c. One Type of Construction.

d. Single Story.

### 7.2.2 OCCUPANCY

#### 7.2.2.1 IBC

| Occupancy | Classification |
|---|---|
| Business | B |
| Storage | S-1 |
| Residential | R-1 |

#### 7.2.2.2 LSC

| Occupancy | Classification |
|---|---|
| Business | B |
| Storage | S |
| Lodging or Rooming | R |

The primary occupancy is Business. The intent of the building is a mixed occupancy, non-separated building. Sleeping rooms and their associated corridors shall be separated by the rest of the facility by a minimum of a 30-minute fire resistant barrier. A 1-hour fire rated wall shall separate the apparatus bays from the administration and sleeping areas.

### 7.2.3 TYPE OF CONSTRUCTION

Classification By Code

a. IBC
    a. Type II-B. Unprotected Noncombustible.

b. NFPA 220
    a. Type II (000). Unprotected Noncombustible.

#### 7.2.3.1 IBC and NFPA 220 Fire-Resistive Requirements

Type-II-B Unprotected Noncombustible.

a. Noncombustible Materials Only

b. Fire-Resistive Requirements (IBC - Table 601).

| Building Element | Protection Required |
|---|---|
| Exterior bearing and nonbearing walls | None |
| Internal bearing walls, structural frame, floors, permanent partitions, and roofs | |
| Roofs-Ceilings/Roofs | None |
| Exterior Opening | None |

| | |
|---|---|
| Sleep Rooms | 30-minute separation (NFPA 101) |
| S-1 to Business Occupancy | 1-hour separation (NFPA 101) |

### 7.2.4 LOCATION OF BUILDING ON PROPERTY

Distance from building to adjacent property line, or center of street, and fire-resistive rating or protection required at each exterior wall and opening- not applicable since the building maintains a minimum distance of 30 feet.

#### 7.2.4.1 IBC (Table 602)

Separation distances for the proposed building are in-excess of the minimum distances for the occupancies in this building. Therefore, there are no restrictions for exterior wall surface exposure and openings.

#### 7.2.4.2 LSC

No requirements.

### 7.2.5 ALLOWABLE FLOOR AREA.

IBC – Table 506.2

Allowable Gross Floor Area (G.F.A.) – Single Floor with Fire Sprinkler System

Business (B) ..... 92,000 Sq. Ft.
Storage (S-1) ..... 70,000 Sq. Ft.
Residential (R-1)..... 64,000 Sq. Ft.

Actual Area ..... 8,079 Sq. Ft.

Area modifications due to frontage increase and fire sprinkler system increase is not required as building is smaller than the three allowable building floor areas

Allowable building area is compliant with IBC.

#### 7.2.5.1 LSC

No area requirements.

### 7.2.6 HEIGHT OF BUILDING AND NUMBER OF STORIES

#### 7.2.6.1 IBC (Table 504.3, 504.4)

Type II-B Construction.

a. Allowable to Proposed Height Comparison

| Occupancy | Mixed |
|---|---|
| Allowable Height of Building | 75 feet |
| Proposed Height of Building (approx.) | 33.25 feet |

Allowable Number of Stories (S-1 criteria) 3
Proposed Number of Stories 1

a. Summary: Height and number of stories are compliant with IBC.

7.2.6.2 **LSC**

No height requirements.

7.2.7 **SPECIAL FEATURES**

a. Portable Fire Extinguisher are not required by UFC 3-600-01 for fully facilities with a fire sprinkler system. No fire extinguishers shall be provided for this facility unless requested by Fort Carson Fire Department.
b. Fire Alarm System required. (LSC)
c. Emergency Lighting required in corridors and assembly areas.
d. Fire Detection System required. (UFC 3-600-01)

7.2.7.1 **Exit Requirements – Life Safety Code 2018 (NFPA 101)**

a. Travel distances to exits shall not exceed 300 ft (per B Occupancy – most stringent).
b. A maximum of 50 feet dead end is allowed (per B Occupancy – most stringent).
c. Egress locations shall be marked with exit signs.

7.2.7.2 **Occupant Load Count and Egress Capacity**

The occupant load count for the building is based upon the following room load factors. Refer to the life safety plans:

| First Floor | Load Factor (sq. ft./person) | Occupant Count |
|---|---|---|
| Business** | 150 | 55 |
| Residential | 200 | 5 |
| Storage | 300 | 10 |

Note:**
Work out room (A-3) 26
Day Room – Conc. Bus. 14

Total Occupant Count is 70.

Egress Size based upon First Floor Occupants: 70 Occupants * .2"/person = 14.0"
Per NFPA 101 - Minimum Width 44"
Egress Size provided averages 48" - Compliant with NFPA 101

Number of Egress Doors Required = 2 (Both Business/Residential Area and Storage Area)
Number of Egress Doors Provided = 2 in Business/Residential Area, 2 in the Storage Area (Apparatus Bay)
Door Egress Capacity of 34" / .2" per person = 170 occupant capacity - Compliant with NFPA 101 (Business/Residential Area = 340 occupants – 60 Actual, Storage = 340 occupants – 10 actual)

Number of doors and size of egress pathways are compliant with code.

7.2.7.3 **Sprinkler System**

A wet pipe sprinkler system shall be provided for this facility per UFC 3-600-01, Fire Protection for Facilities. The water supply shall be from a nearby water tower.

The most stringent sprinkler category is Ordinary. With a sloped ceiling greater than 2 in 12 inches, the area of sprinkler coverage must be increased by 30%. The sprinkler system should provide a minimum of .2 gpm over 2,500 square feet. This is without the area increase due to the roof slope. The required water flow for the sprinkler system will be 650 gpm. The hose allowance for the property is 250 gpm. The duration for the water flow shall be 60 minutes. These are the requirements in UFC 3-600-01. The total water required for fire suppression is 900 gpm. The probable requirements for pressure needed for the system is around 43.8 psig. The nearby tower has a low water pressure of 44 psig. However, based upon communications with Fort Carson DPW, the water tower is never operated that low. It is operated around 54 psig and the pressure is maintained within a few pounds per square inch (psig).

A fire hydrant shall be provided within 150 feet of the fire department connection.

#### 7.2.7.4 **Standpipe System**

A Class I Wet Standpipe is not required for this facility. The fire station does not require the use of a Class I Wet Standpipe based on the following factors (Found in UFC 3-600-01, paragraph 4.5, NFPA 14, and Information paper IMNW-CAR-ESF, 28 September 2007):

a. Class I Standpipes are to be provided in buildings four stories or more in height (UFC 3-600-01) – the fire station is a single-story building.
b. When the distance between the exterior fire apparatus to the furthest point within the facility is in excess of 300 feet, a standpipe is required (Ft Carson Information Paper) – Fire apparatus has accessibility from all four sides of the facility with the furthest point within 250 feet.
c. Exit travel distance from within the facility exceeds 200 feet in sprinkled buildings, a standpipe is required (Ft Carson Information Paper) – the maximum travel distance within the facility to an exit is less than the requirement.

#### 7.2.7.5 **Fire Alarm and Mass Notification System**

A fire alarm and mass notification system shall be provided for the facility in accordance with UFC 4-021-01 Design and O & M: Mass Notification Systems and NFPA 72.

# 8 ELECTRICAL

## 8.2 ELECTRICAL DESIGN:

This design will generally consist of the following systems for the Fire Support Building. The specific systems for each area will vary depending upon the function and facilities applicable to respective areas.

**Interior:**

a) Lighting
b) Equipment Space
c) Panel Boards
d) Cable Trays
e) Conductors
f) Receptacles
g) Interior Telecommunications
h) Uninterruptible Power Systems (UPS)
i) Fire alarm and Mass Notification
j) Station Alert
k) CATV Systems

**Exterior:**

a) Site Lighting
b) Exterior Raceway Systems and Conductors
c) Service Distribution and Transformer
d) Standby Generator
e) Exterior Telecommunications
f) Lightning Protection
g) Cathodic Protection
h) Intrusion Detection Systems

### 8.2.1 Interior Electrical Work:

8.2.1.1 **Lighting:**

Intensities are based on the IES Light Handbook, 9th Edition and UFC 3-530-01 recommendations. Table showing target and maintained illumination levels is attached. This table also shows calculations for AHRAE 189.1 and 90.1 for watts per square foot.

High bay area lighting will consist of industrial weatherproof F38 Fixtures.

Emergency lighting shall illuminate automatically within 15 seconds of failure of normal lighting power. Illumination values shall be sufficient to allow all essential operations. Emergency Egress Lighting will provide an initial minimum of 10 Lux (1 Foot-candle) for all means of egress as required by NFPA 101. Illumination will be provided by unit battery packs installed integral in selected fixtures and wired ahead of any local switching. Exit signage will be red LED with integral battery backup. Exit signage will be located as required by NFPA 101.

Switching for all areas will be via wall-mounted switches located near the entrance to each area or room. Standard wall switches will be rated 277V, 20A.

All rooms will be equipped with occupancy sensors to comply with ASHRAE 90.1.

8.2.1.2 **Equipment Space:**

Electrical equipment space is adequate. It consists of a single main electrical room on the 1st floor. Four electrical panels (4) will be located in the Work Room (21) to lessen lengths of cable runs, and to allow individuals in the Apparatus Bay access to the panel boards feeding their local equipment. Equipment located on Work Room walls will be subjected to water from wash down of trucks and will be provided with enclosures rated for NEMA 4. Significant extra space is required for sub metering because this requires many extra panel boards for proper segregation of load types. Rather than having many step-down transformers to feed the many 120/208V sub metered panel boards, one larger step-down transformer (T1) will be located in the main electrical room. Step down transformer T2 will feed a 120/240V panel board “F” to provide 120 volt, 1-phase power to the fire alarm system panels at the service entrance. T3 will feed 120/240 single phase power to panel LOC. Note that Network Enterprise Center (N.E.C. – comm.) at Fort Carson does not allow step down transformers in Comm. Rooms.

8.2.1.3 **Panel Boards:**

The main distribution panelboard E1 will have integral TVSS and digital metering equipment. The metering equipment will be equipped with pulse initiators. This facility requires a smart meter with values reporting to USC per the FCEEDG. The One-Line Diagram has been designed with segregation of HVAC system loads, people moving loads, lighting loads and process and plug process loads onto separated panels per ASHRAE Standard 189.1-2009, Table 7.3.3.1B so that sub metering can be provided at a later date as required by the 35% Review Conference discussions. However, the actual metering equipment will not be provided or installed under this contract as required by Fort Carson.

Panel boards will be circuit breaker type and will supply all lighting, receptacle, and smaller motor loads. The lugs will be rated for copper conductor connections. Spare capacity in the electrical system will be 15% at the service and 25% in the panel boards.

A dedicated electrical panel is provided for each Telecom Room (TR) with the following minimal requirements: 120/208 volt (V), 3-phase, 12-space panel with a minimum 100-Ampere (A) total capacity. All loads within the TR shall be fed from the dedicated TR panel and not from other

branch circuits.
Panel board size, transformer, and feeder calculations will be completed through the use of load flow analysis in AutoCAD Revit which calculates the EMD of the load. Fault analysis, short circuit analysis, load flow analysis and voltage drop have been calculated for the Final Design Submittal using SKM Dapper Program, with the exception that the main transformer TM, transformer T1 and the back-up generator have been sized using the method prescribed by UFC 03-501-01 which uses historical demand use data by facility type applied to the connected load of the facility.

#### 8.2.1.4 **Cable Trays:**

Ladder-type cable trays are required for all cable distribution within communications rooms. J-hooks were approved for use in all horizontal distribution outside of communications rooms for overhead runs of cable, per the 35% review conference.

Cable trays will be properly grounded and sized for 50% spare capacity.

#### 8.2.1.5 **Conductors:**

Conductors less than 600 volts will be copper and will be sized to allow a 2.0% voltage drop on service entrance and feeder circuits and a 3.0% voltage drop on branch circuits for a maximum of 5% voltage drop at loads. Conductor ampacity will be determined at an ambient temperature rating of 25 degrees C. with 60 degrees C. insulation for conductors #1 AWG and smaller and 75 degrees C. for conductors larger than #1 AWG. Minimum size conductors to be used will be #12 AWG unless noted otherwise. Dedicated neutral conductors will be provided in all single phase circuits. Shared neutrals will only be allowed in 2 and 3 phase load circuits.

A separate green colored grounding conductor will be sized in accordance with NFPA 70 and will be installed in all conduits. A #1/0 copper conductor will be routed from the telephone backboard to the main ground bar in service panel. Conduits for Telecommunications/data conductors will be solidly grounded. Ground rods will be copper clad steel. The main telecommunications backboard in the main telecommunications will have a grounding bar provided for equipment rack bonding. All telecommunication closets will have a grounding bar provided for equipment rack grounding. Selected steel columns will be grounded using ground rods. Main service ground will be in separate raceway than the service feeder from the transformer and bonded near the building at the automatic transfer switch (ATS) which will be service rated. An equipment ground conductor will be run in all conduits and with all circuits.

#### 8.2.1.6 **Receptacles:**

General receptacles will be provided in all areas as required per NFPA 70 and will be NEMA 5-20R duplex, grounding type. GFCI protection will be provided for all NEMA 5-20R receptacles within 6’ of a sink and for all receptacles mounted on the exterior of the buildings and other areas as required per code.
Arc Fault Interrupter (AFI) receptacles will be provided in all sleeping areas as required by N.E.C. Article 210.12(A).

All other areas of the building will be fed from wall outlets directly to feed the workstations. Conduits from the wall outlets and the cast in place boxes will be run to respective panel boards under the slab and through adjacent walls, above ceiling to the panel boards.

Retractable cable reels with 120V, 1 phase plugs will be provided adjacent to each fire truck in the Apparatus Bay to provide power to each fire truck.

Exterior receptacles on the buildings will be GFCI protected type with in-use lockable weatherproof cover. Receptacles will be provided at convenient locations around the exterior perimeter of the building and as required.

### 8.2.1.7 Interior Communications:

Telecommunication outlets will include voice, data and NIPRNET. SIPRNET is NOT required for this facility.

#### 8.2.1.7.1 Standard Communications Requirements:

a. Typical user network interface shall be two RJ45 jacks; Category 6 copper; UTP for voice; UTP for data; to local telecommunications room.
b. Plenum rated, category 6 copper; UTP per UFC 3-580-01 Technical Criteria standard from local telecommunications room to main telecommunications room for voice.
c. Single-mode, 12 strand fiber optic cable from Main Telecom Room 15 for data.

#### 8.2.1.7.2 Jack Color Coding:

a. Voice Jacks – blue.
b. Data Jacks – orange.

#### 8.2.1.7.3 Cable Color Coding:

a. Voice Cabling – blue.
b. Data Cabling – white.
c. Station Alert Cabling – green.

### 8.2.1.8 Uninterruptible Power Systems:

A UPS with a minimum of 15 minutes of run time capacity at full load to allow for generator override or orderly shutdown of critical loads if the generator power fails to go on line will be provided. UPS is specified to comply with NFPA 111 for Type O, Class 0.25, Category B, Level 1. Batteries will be gel valve regulated lead-acid (VRLA) type. The UPS shall be provided with a bypass switch that maintains the power connection during switchover and that is capable of isolating all UPS components while allowing power to flow from the source to the load.

The Facility UPS provides backup power to the Main Telecomm. Room 15.
The facility Fire Alarm System will be provided with its own back up battery system. The facility Fire Alarm System is required to be connected directly to the facility service equipment through a dedicated panel (panel “F”) by UFC 3-520-01, paragraph 3-2.4 Power for Fire Protection Systems (not through the UPS systems).

### 8.2.1.9 Fire Alarm and Mass Notification:

A new Class B addressable fire detection and alarm shall be installed per NFPA 72. The systems will be an addressable intelligent (Class B) combined fire alarm (FA) per NFPA 72, UFC 3-600-01, except as modified below. Every room, corridor, etc. will contain speakers and strobes located per NFPA 72. A Monaco BT-X transceiver compatible with the head end equipment at Ft Carson, CO will be provided. The transceiver will transmit individual TROUBLE or ALARM signals from fire alarm control panel (FACP) to the base remote monitoring station. The system shall be fully compatible with the existing Monaco Alarm Monitoring System at Fort Carson, CO.

The following requirements for the fire alarm system will be provided:

a. Addressable fire alarm system.
b. Main fire alarm panel (FACP) located in the Electrical Room 19.
c. Fire Alarm Map Board (drawing only – no LEDs) located in the Electrical Room 19.
d. Smoke detection in the Electrical Room 19 located above the FACP.
e. Hydrogen detection in the Electrical Room 19 located above the facility UPS.
f. Carbon monoxide (CO) and smoke detectors (duct detectors) for mechanical equipment where required.
g. Monitor Post Indicator Valve (PIV) tamper switch.
h. Trouble signal monitoring, but not shut down of HVAC equipment duct detectors.
i. Provide door releases on the access control security point doors so that when the fire alarm system is activated the access control security point doors are released to allow personnel egress.
j. Carbon monoxide (CO) and smoke detectors (combination smoke and heat elements) in all sleeping quarters. CO triggers AV alarm at device, AV common trouble signal at main fire alarm panel and RL. Smoke element triggers AV alarm at device, AV common trouble signal at main fire alarm panel and RL. Heat element triggers AV alarm at device, common alarm signal remote from station, release all applicable door holders and RL.

Public address requirements will be provided by the station alert system. See requirements (below) for the station alert system.

A separate mass notification system will not be provided for the Fire Support Building as is normally required by UFC 4-021-01. Mass Notification will be provided by the Station Alert System. Reference paragraph “Station Alert System” (below) for a description of the Station Alert System.

8.2.1.10 **Station Alert:**

A Station Alert System is required for the Fire Support Building. Procurement of a Station Alert System on a Sole-Source Basis is required for a WestNET First Alert system. The WestNET system will be design-build by WestNET. Firm pricing will be required so a CLIN can be added to the solicitation.

The General Contractor (GC) will be required to subcontract to WestNET as the design-builder for the station alert system.

Following are the base line parameters for the Station Alert System:

a. Contract electricians provide conduit rough-in and power for system as part of the USACE construction contract.
b. Computer based dispatching and alert system.
c. LED indicating panel w/speaker for visual and audio coding for fire calls in ceilings throughout the facility with a maximum of 20 alert stations.
d. Wall mounted alert panel in each sleeping room (5 dorm rooms).
e. Mass Notification speakers with coverage throughout the facility.
f. Local Operators Console (LOC) in the Officer’s Office.
g. PA system speakers and horns.
h. Door Bell systems at the main facility entry.
i. Panic Button in the Officer’s Office.
j. Radio System connections.

k. Paging via desk phones (cross-connect to Station Alert from telephone system).
l. System has its own equipment racks with a dedicated UPS.
m. Dedicated cable network loop around facility routed through comm. system cable trays and conduits where necessary. Cable would have unique color designation, green.
n. Proprietary system based on a Lenel System (http://www.lenel.com/) equipment and First Due (http://www.firstduefire.net/FIRST_DUE_FIRE_EQUIPMENT/Welcome.html) and WestNET (http://www.firestationalerting.com/) integrators/installers.

#### 8.2.1.11 CATV Systems:

A CATV system will be provided for the facility. The Fire Support Building CATV system will include CATV jacks, coaxial cables and equipment in the communication rack(s) in the Comm. Room. CATV jacks will be provided in all sleeping quarters (5), day room/training, officer's office, and in the workout area.

### 8.2.2 Exterior Electric Work:

#### 8.2.2.1 Site Lighting:

a. The proposed parking lot light fixtures will be shoe box style fixtures with 277 volt, LED lamps (per Fort Carson Exterior Electrical Distribution & Installation Design Guide) building mounted at 19 feet. The light fixtures will have an anodized bronze finish. The layout will be designed to achieve a minimum of 0.5 foot-candles (5.4 lux) average. Lights will be turned on through a photocell and turned off by a timer.
b. Building security lights will be comprised of LED wall packs located on exterior wall and at the exterior doors. Light fixtures will be turned on through a photocell and turned off by a timer.

#### 8.2.2.2 Exterior Raceway Systems and Conductors:

Electrical power will enter the building from the West. See ES series sheets for routing pathway/clarification. The existing overhead line will be tapped and routed to the new site, including new power poles located approximately every 200 feet. The overhead lines shall be converted to a new underground feeder at the location noted on ES101 (#350 aluminum, single conductor with 133% EPR insulation and concentric 1/3 neutral) to the new pad mounted transformer. This connection will be about 4000 feet in length. This will include installation of approximately 19 new power poles, with 2 handholes included for the underground portion of the pathway. The electrical pathway has the option to tap the existing overhead lines and converted to a new underground feed for the entire utility run, including manholes every 500 feet. This will include installation of 1 new overhead to underground transition pole, with approximately 10 handholes. The new transformer will step voltage from 12,470 volts down to 480/277 volts, three phase. The facility transformer size will be 300 kVA.

#### 8.2.2.3 Service Distribution and Transformer:

Estimated transformer size is a 300 KVA, 12470-480/277V; 3 PH, pad mounted transformer. Note that the Fire Support Building as currently designed has 7,130 sq.ft. Standard size transformers supplying this area would have power densities on a square footage basis, as follows:

150 kVA----------21.04 VA/sq.ft.
225 kVA----------31.56 VA/sq.ft
300 kVA----------42.08 VA/sq.ft. <-----Current Estimate

500 kVA----------70.13 VA/sq.ft.
750 kVA----------105.19 VA/sq.ft.

#### 8.2.2.4 Standby Generator:

The Fire Support Building will be provided with 100% back-up power from a generator as required by the COS standard. Generator will be specified to comply with NFPA 110 for Class X (minimum time 72 hours), Level 1, Type 10. The service rated ATS will be specified with a bypass-isolation switch to bypass and isolate the transfer switch. Current estimated size is a 267 kVA, 480/277V; 3 PH., 4W diesel generator. A fuel tank (belly tank) will be provided to serve the generator for 72 hours of operation at full load. An automatic transfer switch will be used to transfer power upon normal power failure to serve the entire Fire Support Building load. A dedicated 120/208V, 3 phase, 60A power panel (Panel G) will be provided at the generator to supply all generator auxiliary loads such as battery chargers, fuel pumps, and blanket heaters.

#### 8.2.2.5 Exterior Telecommunications:

Communications will enter the new Fire Support Building communications room from existing handhole HH1106E to the South of the site. See T- series sheets for routing pathway. OSP communication shall be new twelve (12) strand dielectric single mode fiber optic cable in a 2-4" hardened concrete encased duct bank. 4'x4'x6' handholes shall be provided at change of direction, with entry to handholes occurring at 90 degrees. This connection will be about 500 feet. Copper will not be required to the new facility.

#### 8.2.2.6 Lightning Protection:

A complete lightning protection system will be designed and installed to conform to NFPA 780. The lightning protection and grounding system will include air terminals, down conductors, ground rods and a ground ring (#4/0 copper counterpoise conductor around the perimeter of the facility). The roof lightning protection system, perimeter structural steel columns and the service entrance will all be bonded to the building counterpoise system.

#### 8.2.2.7 Cathodic Protection:

A galvanic anode type cathodic protection (CP) system will be provided to protect ferrous piping, valves and fittings per the cathodic protection specification edited for Fort Carson. No CP details will be provided in the design. CP details and design will be provided by the Contractor's CP expert during the submittal stage of construction.

#### 8.2.2.8 Intrusion Detection Systems:

Rough-in (junction boxes, conduit w/pull wires, and power circuits) for an intrusion detection system will be provided. Intrusion Detection System for Lenel System with dual keypad and proximity card readers (equipment By Others). The security system will be installed by Ft. Carson at a later date.

# 9 CYBERSECURITY

## 9.1 REFERENCES

ECB 2018-11 Control System Cybersecurity Coordination Requirement
FISMA
NIST 800 series as applicable
NIST Risk Framework for Improving Critical Infrastructure Cybersecurity
UFC 4-010-06 Cybersecurity of Facility Related Control Systems

### 9.1.1 General

Facility Related Control Systems (FRCS) are systems integral to real property which implement control through the use of operational information technology to ensure the security and protection of real property, life safety and comfort of occupants; enhance efficiency and lower facility costs; monitor and record process data; used for manufacturing, product handling, production and control of geographically dispersed assets; and are automatic with varying degrees of human/manual intervention for operation where real property is of a permanent and immovable nature, and may consist of utilities, campuses, and structures. All FRCS shall be planned, designed, acquired, executed, and maintained in accordance with UFC 4-010-06, NIST SP 800-53r5, NIST SP 800-82r2, NIST Framework for Improving Critical Infrastructure Cybersecurity, and as required by the individual Service Implementation Policy.

Cybersecurity implementation begins with an inventory of the project FRCS through a thorough review in coordination with all disciplines. Control systems are categorized into various enclaves and respective System Owners (SO) are contacted for determining appropriate C-I-A (confidentiality-integrity-availability) Impact Levels.

C-I-A Impact Levels are an initial evaluation of the risk associated with the information exchange. Risk to the Government if data (information) is released; Risk to the Government if data is erroneous; Risk to the Government if system malfunctions and data is lost or there is a loss of power loss i.e., unavailable. All control systems have a certain element of risk associated with the dependability of their functionality. Engineering designers who integrate facility related control systems/industrial control systems (ics) in the design and SO's who request that control systems be included in design of real property have reasons and an understanding of why the systems are being included in the project. Assignment of C-I-A Impact Levels is the first step in what is known as the Risk Management Framework (RMF) process.

Since locating the SO for each frcs/ics enclave may be the most challenging task in the RMF process and the RMF process cannot delay the contract, the cybersecurity professional is permitted to assign the initial C-I-A Impact Level ratings based upon the "Distribution of Facility-Related Controls Master List Memo signed 7-16-2021" and "Addendum - FRCS Master List Final_20210716". As project design progresses the ratings may elevate or reduce depending upon design evolution and through subsequent project reviews. SO's can be identified during the review period and, through, comment review the SO can make

appropriate C-I-A assignments. Since the SO is responsible for the respective frcs/ics enclave and they are responsible for assigning the C-I-A Impact Level, it's crucial that they have knowledge of each frcs/ics. Something as simple as a notification to the SO for an added component to an existing system i.e., a gas/water/power meter or demolition of an existing building automation system (BAS) can facilitate their work. It's crucial that they be included in reviews. It's also crucial to include the Information System Security Officer/Manager (ISSO/ISSM), who will likely be responsible for acceptance of the system and subsequent issuance of an Authority to Operate (ATO).

C-I-A Impact Level Ratings are assigned based upon mission category. The mission will be support, essential or critical. Associated C-I-A Impact Level Rating will be Low (L), Moderate (M), or High (H).

It's important to understand that the Federal Information Security Modernization Act (FISMA) or Title 44 United States Code of Federal Regulations Part 3554 is a law that is a mandate that requires cybersecurity implementation for all federally owned information systems and information exchanges with many cost and schedule unknowns associated with application to facility related control systems. Cost reduction through efficiencies, and coordination should always be considered.

### 9.1.2 **Scope**

The Information System Security Manager, and System Owner for each of the platforms on this project at the Fort Carson Installation are:

Mr. Martin Wenglikowski, Chief, Cybersecurity Division RNEC-West; 719-503-9505; martin.l.wenglikowski.civ@army.milmailto:Edward.negron-velez.civ@army.mil

Mrs. Gwen Anderson, Fort Carson RNEC Cyber Security Division; 719-503-9697; Gwendolyn.r.anderson7.civ@army.mil.

The Mission Status for the facility is unknown, at this time. The C-I-A Impact Level Rating for all systems have not yet been determined.

FRCS at this time for this project, which will require cybersecurity controls implementation, in accordance with UFC 04 010 06, are:

Automated Doors (Access Control) (Division 8 specifications)- Configurable Systems.

Mechanical Heating Ventilation/Air Conditioning (HVAC) System (Division 23 specifications).

Fire Protection System (Divisions 21 and 28 specifications).

Utility Monitoring and Control System (UMCS) (Division 25 specifications).

Generator and Automatic Transfer Switch (Division 26 specifications)- Configurable Systems.

Uninterruptible Power System (UPS) (Division 26 specifications)- Configurable Systems.

Fueling System (Division 33 specifications)- Configurable Systems.

Industrial Process Control (Division 40 specifications)- Configurable Systems.

Refer to appendix for CCI (Control Correlation Identifier) Lists for each of the systems identified above.

Action Items:

1. Confirm the SO, ISSO/ISSM.
2. Categorize the facility as support, essential or critical.
3. Assign preliminary CIA Impact Level Ratings from FRCS Master List.
4. Obtain the CIA Impact Level Ratings from the ISSO/ISSM/SO.

# 10 ENVIRONMENTAL PROTECTION AND COMPLIANCE

## 10.1 GENERAL

The Fire Station Support Facility (Turkey Creek) project at Fort Carson, CO has been reviewed for applicable environmental protection requirements, compliance, construction permits, notices, reviews and/or approvals. The following items have been identified and will be reviewed again for each design submittal phase.

## 10.2 AIR POLLUTANT EMISSION SOURCES

### 10.2.1 Fugitive Dust

For fugitive dust during construction, the State of Colorado requires that an Air Pollution Emission Notice (APEN) is submitted for a Fugitive Dust permit for projects lasting longer than 6 months of construction time and/or are more than 25 acres of land development. Since this project will last longer than 6 months of construction, an APEN is required to be submitted for a Fugitive Dust Permit. The Contractor will submit the APEN directly to the State of Colorado as soon as the authority to advertise is received. The requirements that will be the Contractor's responsibility during construction will be included in the body of the specification or as an attachment. The Contractor will provide a copy of the permit to Fort Carson Directorate of Public Works (DPW), Environmental Division, Air Program.

### 10.2.2 Title V Air Permit Emissions

All equipment that has the possibility to emit air emissions will be reviewed for compliance and permit requirements with Fort Carson’s Title V Air Permit. If the air pollutant emissions are not a significant amount to require a permit to construct, but the air pollutant emissions will be added to Fort Carson’s Title V Air Permit’s Yearly Inventory.

### 10.2.3 Demolition

If there is demolition it will require either a State of Colorado Demolition/Notification permit or an El Paso County Demolition permit. If Fort Carson removes the asbestos, fluorescent lighting, exit signs, and ballast prior to the Contractor demolishing the building, the Contractor will still be required to notify the State and to coordinate the notification with Fort Carson.

## 10.3 WATER POLLUTANT SOURCES

### 10.3.1 Storm Water Discharge During Construction

Coverage under EPA’s **NPDES Storm Water General Permit for Construction Sites over 5 Acres** on Federal Lands **will be required.** The Contractor and the Omaha District Corps of Engineers will be co-permittees. Section 01 57 20.00 10 Environment Protection and Section 01 41 26.05 24 (FEDERAL FACILITIES COLORADO) NPDES Storm Water General Permit for Construction Sites over an acre will be in the contract specifications and will specify the requirements for compliance with the permit.

### 10.3.2 Construction Waste Water

Construction Waste Water will not be allowed to be discharged to the environmental. Water used in

on-site material processing, concrete curing, foundation and concrete cleanup shall not be allowed to discharge without being treated and shall not enter a stream. Wash-water from items such as concrete trucks, forms, etc. shall either be disposed off government property or at a site designated by the base. At the designated site, the Contractor will be required to construct a wash pit in a dirt area. Direct wash water into a leak-proof container or leak-proof and lined pit designed so that no overflows can occur due to inadequate sizing or precipitation. The residue left in the pit after completion of the project would be removed and disposed off the government property. The area would be backfilled to original grade, top-soiled and seeded/sodded.

### 10.3.3 Dewatering Of Ground Water

No pumping of ground water is anticipated. If ground water pumping is required, Fort Carson has directed that all ground water is to be land applied. Land application implies that the Contractor shall discharge water at a rate, which allows the water to percolate into the soil. The requirements will be included in Specification Section 01 57 20.00 10. The Contractor will be required to follow Fort Carson Stormwater Program dewatering requirements. A separate dewatering permit is not required if water is discharged in accordance with EPA's 2017 Construction General Permit.

### 10.3.4 Sewer Mains, Lift Stations, Water Mains, And Fire Hydrants

New sewer mains, water mains, and fire hydrants on Fort Carson are not required to obtain a permit to construct.

### 10.3.5 Backflow Preventers

Any new backflow preventers will be added to Fort Carson's backflow preventer inventory. **No permit to construct** is required.

### 10.3.6 Erosion And Stormwater Quality Control Permit (Esqcp)

If more than 1 acre of ground is to be disturbed on non-federal facilities (private property) the Contractor shall be responsible for obtaining a Erosion and Stormwater Quality Control Permit from El Paso County, Colorado. A copy of the permit and requirements may be found at El Paso County, Colorado web site http://adm.elpasoco.com/Development%20Services/Pages/InspectionsHomePage.aspx. The Contractor shall be responsible for any fees associated with this permit. Copies of any permits shall be furnished to the COR for approval prior to submission to El Paso County.

## 10.4 HISTORICAL, ARCHAELOGICAL, CULTURAL, AND BIOLOGICAL RESOURCES

There are no known historical, archaeological, cultural, or biological resources on the project site. The barracks to be demolished are not historical. There are no wetlands on the site per Fort Carson DPW office.

## 10.5 MISCELLANEOUS ENVIRONMENTAL COMPLIANCE COMMON TO A CONSTRUCTION SITE

The Environmental Protection Specification Section 01 57 20.00 10 will be included in the Contract Specification to ensure that environmental concerns shall be addressed. The following items have been addressed.

### 10.5.1 **Environmental Protection Plan**

The Environmental Protection Plan for the project includes several miscellaneous plans such as a Spill Control Plan, Recycling and Waste Minimization Plan, Contaminant Prevention Plan, etc. The plan is submitted prior to construction starting on site for review and acceptance.

### 10.5.2 **Environmental Permits**

A paragraph in the Environment Protection specification section will address Fort Carson's environmental permits and any requirements for the Contractor.

### 10.5.3 **Special Environmental Protection**

The Environment Protection specification shall address the following environmental concerns: Disposal of Solid Waste, Contractor Generated Hazardous Wastes, Fuels and Lubricants, Historical, Archaeological, Cultural, and Protection of Land, Air and Water Areas, etc.

# APPENDICES

## A – CYBERSECURITY APPENDIX

# APPENDIX A – CYBERSECURITY APPENDIX

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**FIRE PROTECTION CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-000016 | The information system automatically removes or disables temporary accounts after an organization-defined time period for each type of account. | AC-2 (2), AC-2 (2).1 (ii) | Implemented by Information System in Part 3.3.1.3. |
| CCI-000017 | The information system automatically disables inactive accounts after an organization-defined time period. | AC-2 (3), AC-2 (3).1 (ii) | Implemented by Information System in Part 3.3.1. |
| CCI-000018 | The information system automatically audits account creation actions. | AC-2 (4), AC-2 (4).1 (i and ii) | Implemented by Information System in Part 3.3.1. |
| CCI-000039 | The organization requires that users of information system accounts or roles, with access to organization-defined security functions or security-relevant information, use non-privileged accounts, or roles, when accessing nonsecurity functions. | AC-6 (2), AC-6 (2).1 (ii) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-000043 | The organization defines the maximum number of consecutive invalid logon attempts to the information system by a user during an organization-defined time period. | AC-7, AC-7.1 (i) | Policy Implemented in Part 3.3.2. |
| CCI-000044 | The information system enforces the organization-defined limit of consecutive invalid logon attempts by a user during the organization-defined time period. | AC-7 a, AC-7.1 (ii) | Implemented by Information System in Part 3.3.2. |
| CCI-000048 | The information system displays an organization-defined system use notification message or banner before granting access to the system that provides privacy and security notices consistent with applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance. | AC-8 a, AC-8.1 (ii) | Implemented by Information System in Part 3.3.3. |
| CCI-000050 | The information system retains the notification message or banner on the screen until users acknowledge the usage conditions and take explicit actions to log on to or further access the information system. | AC-8 b, AC-8.1 (iii) | Implemented by Information System in Part 3.3.3. |

| CCI-000765 | The information system implements multifactor authentication for network access to privileged accounts. | IA-2 (1), IA-2 (1).1 | Implemented by Information System in Part 3.4. |
| CCI-000768 | The information system implements multifactor authentication for local access to non-privileged accounts. | IA-2 (4), IA-2 (4).1 | Implemented by Information System in Part 3.4. |
| CCI-000777 | The organization defines a list of specific and/or types of devices for which identification and authentication is required before establishing a connection to the information system. | IA-3, IA-3.1 (i) | Policy Implemented in Part 3.2.7. |
| CCI-000778 | The information system uniquely identifies an organization-defined list of specific and/or types of devices before establishing a local, remote, or network connection. | IA-3, IA-3.1 (ii) | implemented by Information System in Part 3.2.7. |
| CCI-000779 | The information system authenticates devices before establishing remote network connections using bidirectional authentication between devices that is cryptographically based. | IA-3 (1), IA-3 (1).1 (i) | Implemented by Information System in Part 1.8.4. |
| CCI-000803 | The information system implements mechanisms for authentication to a cryptographic module that meet the requirements of applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance for such authentication. | IA-7, IA-7.1 | Implemented by Information System in Part 3.2.8. |
| CCI-000865 | The organization approves information system maintenance tools. | MA-3, MA-3.1 (i) | Policy Implemented in Part 3.9. |
| CCI-000928 | The organization enforces physical access authorizations to the information system in addition to the physical access controls for the facility where the information system resides at organization-defined physical spaces containing one or more components of the information system. | PE-3 (1), PE-3 (1).1 | Policy Implemented in Part 3.3.6. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-000936 | The organization controls physical access to organization-defined information system distribution and transmission lines within organizational facilities using organization-defined security safeguards. | PE-4, PE-4.1 | Policy Implemented in Part 3.3.6. |
| CCI-000937 | The organization controls physical access to information system output devices to prevent unauthorized individuals from obtaining the output. | PE-5, PE5.1 | Policy Implemented in Part 3.3.6. |
| CCI-000952 | The organization protects power equipment and power cabling for the information system from damage and destruction. | PE-9, PE-9.1 | Policy Implemented in Part 3.10. |
| CCI-000961 | The organization provides a long-term alternate power supply for the information system that is capable of maintaining minimally required operational capability in the event of an extended loss of the primary power source. | PE-11 (1), PE-11 (1).1 | Policy Implemented in Part 3.10. |
| CCI-001054 | The organization scans for vulnerabilities in the information system and hosted applications on an organization-defined frequency. | RA-5 a, RA-5.1 (ii) | Policy Implemented in Part 3.11. |
| CCI-001055 | The organization defines a frequency for scanning for vulnerabilities in the information system and hosted applications. | RA-5 a, RA-5.1 (i) | Policy Implemented in Part 3.11. |
| CCI-001056 | The organization scans for vulnerabilities in the information system and hosted applications when new vulnerabilities potentially affecting the system/applications are identified and reported. | RA-5 a, RA-5.1 (iii) | Policy Implemented in Part 3.11. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-001057 | The organization employs vulnerability scanning tools and techniques that facilitate interoperability among tools and automate parts of the vulnerability management process by using standards for: enumerating platforms, software flaws, and improper configurations; formatting checklists and test procedures; and measuring vulnerability impact. | RA-5 b, RA-5.1 (iv) | Policy Implemented in Part 3.11. |
| CCI-001058 | The organization analyzes vulnerability scan reports and results from security control assessments. | RA-5 c, RA-5.1 (v) | Policy Implemented in Part 3.11. |
| CCI-001059 | The organization remediates legitimate vulnerabilities in organization-defined response times in accordance with an organizational assessment risk. | RA-5 d, RA-5.2 (ii) | Policy Implemented in Part 3.11. |
| CCI-001062 | The organization employs vulnerability scanning tools that include the capability to readily update the information system vulnerabilities to be scanned. | RA-5 (1), RA-5 (1).1 | Policy Implemented in Parts 2.3 and 3.11. |
| CCI-001067 | The information system implements privileged access authorization to organization-identified information system components for selected organization-defined vulnerability scanning activities. | RA-5 (5), RA-5 (5).1 (ii) | Implemented by Information System in Parts 2.3 and 3.11. |
| CCI-001082 | The information system separates user functionality (including user interface services) from information system management functionality. | SC-2, SC-2.1 | Implemented by Information System in Part 3.7.2. |
| CCI-001093 | The organization defines the types of denial of service attacks (or provides references to sources of current denial of service attacks) that can be addressed by the information system. | SC-5 | Policy Implemented in Part 3.7.2. |
| CCI-001094 | The information system restricts the ability of individuals to launch organization-defined denial of service attacks against other information systems. | SC-5 (1), SC-5 (1).1 | Implemented by Information System in Part 3.2.4. |

|---|---|---|---|
| CCI-001967 | The information system authenticates organization-defined devices and/or types of devices before establishing a local, remote, and/or network connection using bidirectional authentication that is cryptographically based. | IA-3 (1) | Implemented by Information System in Part 3.2.5. |
| CCI-001989 | The organization manages information system authenticators by changing default content of authenticators prior to information system installation. | IA-5 e | Policy Implemented in Part 3.4. |
| CCI-002002 | The organization defines the token quality requirements to be employed by the information system mechanisms for token-based authentication. | IA-5 (11) | Policy Implemented in Part 3.4. |
| CCI-002003 | The information system, for token-based authentication, employs mechanisms that satisfy organization-defined token quality requirements. | IA-5 (11) | Implemented by Information System in Part 3.4. |
| CCI-002007 | The information system prohibits the use of cached authenticators after an organization-defined time period. | IA-5 (13) | Implemented by Information System in Part 3.4. |
| CCI-002041 | The information system allows the use of a temporary password for system logons with an immediate change to a permanent password. | IA-5 (1) (f) | Implemented by Information System in Part 3.4. |
| CCI-002046 | The information system synchronizes the internal system clocks to the authoritative time source when the time difference is greater than the organization-defined time period. | AU-8 (1) (b) | Implemented by Information System in Part 3.5.2. |
| CCI-002102 | The organization defines the information system components or classes of components that are authorized internal connections to the information system. | CA-9 (a) | Policy Implemented in Part 1.8.3. |
| CCI-002104 | The organization documents, for each internal connection, the security requirements. | CA-9 (b) | Policy Implemented in Part 1.8.3. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002105 | The organization documents, for each internal connection, the nature of the information communicated. | CA-9 (b) | Policy Implemented in Part 1.8.3. |
| CCI-002110 | The organization defines the information system account types that support the organizational missions/business functions. | AC-2 a | Policy Implemented in Part 3.3.1. |
| CCI-002130 | The information system automatically audits account enabling actions. | AC-2 (4) | Technical Implemented in Part 3.3.1. |
| CCI-002132 | The information system notifies organization-defined personnel or roles for account enabling actions. | AC-2 (4) | Technical Implemented in Part 3.3.1. |
| CCI-002221 | The organization defines the security-relevant information for which access must be explicitly authorized. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002222 | The organization explicitly authorizes access to organization-defined security functions. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002223 | The organization explicitly authorizes access to organization-defined security-relevant information. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002234 | The information system audits the execution of privileged functions. | AC-6 (9) | Implemented by Information System in Parts 3.3.1 and 3.4. |
| CCI-002235 | The information system prevents non-privileged users from executing privileged functions to include disabling, circumventing, or altering implemented security safeguards/countermeasures. | AC-6 (10) | Implemented by Information System in Parts 3.3.1 and 3.4. |
| CCI-002236 | The organization defines the time period the information system will automatically lock the account or node when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Policy Implemented in Part 3.3.2. |
| CCI-002237 | The organization defines the delay algorithm to be employed by the information system to delay the next logon prompt when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Policy Implemented in Part 3.3.2. |

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002238 | The information system automatically locks the account or node for either an organization-defined time period, until the locked account or node is released by an administrator, or delays the next logon prompt according to the organization-defined delay algorithm when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Implemented by Information System in Part 3.2. |
| CCI-002243 | The organization-defined information system use notification message or banner is to state that users are accessing a U.S. Government information system. | AC-8 a 1 | Policy Implemented in Part 3.3.3. |
| CCI-002244 | The organization-defined information system use notification message or banner is to state that information system usage may be monitored, recorded, and subject to audit. | AC-8 a 2 | Policy Implemented in Part 3.3.3. |
| CCI-002245 | The organization-defined information system use notification message or banner is to state that unauthorized use of the information system is prohibited and subject to criminal and civil penalties. | AC-8 a 3 | Policy Implemented in Part 3.3.3. |
| CCI-002246 | The organization-defined information system use notification message or banner is to state that use of the information system indicates consent to monitoring and recording. | AC-8 a 4 | Policy Implemented in Part 3.3.3. |
| CCI-002247 | The organization defines the use notification message or banner the information system displays to users before granting access to the system. | AC-8 a | Policy Implemented in Part 3.3.3. |
| CCI-002248 | The organization defines the conditions of use which are to be displayed to users of the information system before granting further access. | AC-8 c 1 | Policy Implemented in Part 3.3.3. |
| CCI-002252 | The organization defines the accounts and/or account types for which the information system will limit the number of concurrent sessions. | AC-10 | Policy Implemented in Parts 3.2.2 and 3.3.4. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002323 | The organization establishes configuration/connection requirements for wireless access. | AC-18 a | Policy Implemented in Part 3.3.1. |
| CCI-002360 | The organization defines the conditions or trigger events requiring session disconnect to be employed by the information system when automatically terminating a user session. | AC-12 | Policy Implemented in Part 3.3.4. |
| CCI-002361 | The information system automatically terminates a user session after organization-defined conditions or trigger events requiring session disconnect. | AC-12 | Implemented by Information System in Part 3.3.4. |
| CCI-002385 | The information system protects against or limits the effects of organization-defined types of denial of service attacks by employing organization-defined security safeguards. | SC-5 | Implemented by Information System in Part 3.7.2. |
| CCI-002386 | The organization defines the security safeguards to be employed to protect the information system against, or limit the effects of, denial of service attacks. | SC-5 | Policy Implemented in Part 3.7.2. |
| CCI-002396 | The organization protects the confidentiality and integrity of the information being transmitted across each interface for each external telecommunication service. | SC-7 (4) (c) | Policy Implemented in Part 3.7.5. |
| CCI-002397 | The information system, in conjunction with a remote device, prevents the device from simultaneously establishing non-remote connections with the system and communicating via some other connection to resources in external networks. | SC-7 (7) | Implemented by Information System in Part 3.7.5. |
| CCI-002398 | The information system detects outgoing communications traffic posing a threat to external information systems. | SC-7 (9) (a) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |
| CCI-002399 | The information system denies outgoing communications traffic posing a threat to external information systems. | SC-7 (9) (a) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002400 | The information system audits the identity of internal users associated with denied outgoing communications traffic posing a threat to external information systems. | SC-7 (9) (b) | Implemented by Information System in Part 3.5.1. |
| CCI-002401 | The organization defines the authorized sources from which the information system will allow incoming communications. | SC-7 (11) | Policy Implemented in Part 1.8.2. |
| CCI-002402 | The organization defines the authorized destinations for routing inbound communications. | SC-7 (11) | Policy Implemented in Part 1.8.2. |
| CCI-002403 | The information system only allows incoming communications from organization-defined authorized sources routed to organization-defined authorized destinations. | SC-7 (11) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |
| CCI-002418 | The information system protects the confidentiality and/or integrity of transmitted information. | SC-8 | Implemented by Information System in Parts 3.2.5 and 3.3.6. |
| CCI-002419 | The organization defines the alternative physical safeguards to be employed when cryptographic mechanisms are not implemented to protect information during transmission. | SC-8 (1) | Policy Implemented in Part 3.3.6. |
| CCI-002421 | The information system implements cryptographic mechanisms to prevent unauthorized disclosure of information and/or detect changes to information during transmission unless otherwise protected by organization-defined alternative physical safeguards. | SC-8 (1) | Implemented by Information System in Part 3.3.6. |
| CCI-002430 | The organization defines the requirements for cryptographic key storage to be employed within the information system. | SC-12 | Policy Implemented in Part 3.7.2. |
| CCI-002449 | The organization defines the cryptographic uses, and type of cryptography required for each use, to be implemented by the information system. | SC-13 | Policy Implemented in Part 3.2.5. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002450 | The information system implements organization-defined cryptographic uses and type of cryptography required for each use in accordance with applicable federal laws, Executive Orders, directives, policies, regulations, and standards. | SC-13 | Implemented by Information System in Part 3.2.5. |
| CCI-002470 | The information system only allows the use of organization-defined certificate authorities for verification of the establishment of protected sessions. | SC-23 (5) | Implemented by Information System in Part 3.2.7. |
| CCI-002472 | The organization defines the information at rest that is to be protected by the information system. | SC-28 | Policy Implemented in Part 3.7.4. |
| CCI-002475 | The information system implements cryptographic mechanisms to prevent unauthorized modification of organization-defined information at rest on organization-defined information system components. | SC-28 (1) | Implemented by Information System in Part 3.7.4. |
| CCI-002476 | The information system implements cryptographic mechanisms to prevent unauthorized disclosure of organization-defined information at rest on organization-defined information system components. | SC-28 (1) | Implemented by Information System in Part 3.7.4. |
| CCI-002544 | The organization defines the information systems or information system components on which organization-defined connection ports or input/output devices are to be physically disabled or removed. | SC-41 | Policy Implemented in Part 3.6. |
| CCI-002545 | The organization defines the connection ports or input/output devices that are to be physically disabled or removed from organization-defined information systems or information system components. | SC-41 | Policy Implemented in Part 3.6. |
| CCI-002546 | The organization physically disables or removes organization-defined connection ports or input/output devices on organization-defined information systems or information system components. | SC-41 | Technical Implemented in Part 3.6. |

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002605 | The organization installs security-relevant software updates within an organization-defined time period of the release of the updates. | SI-2 c | Technical Implemented in Part 1.9. |
| CCI-002623 | The organization defines the frequency for performing periodic scans of the information system for malicious code. | SI-3 c 1 | Policy Implemented in Part 3.13.1. |
| CCI-002645 | The organization defines the techniques and methods to be used to identify unauthorized use of the information system. | SI-4 b | Policy Implemented in Part 3.13.3. |
| CCI-002737 | The organization prohibits the use of binary or machine-executable code from sources with limited or no warranty and without the provision of source code. | SI-7 (14) (a) | Policy Implemented in Part 1.9. |
| CCI-002773 | The organization defines the fail-safe procedures to be implemented by the information system when organization-defined failure conditions occur. | SI-17 | Policy Implemented in Parts 1.8.4 and 3.8. |
| CCI-002774 | The organization defines the failure conditions which, when they occur, will result in the information system implementing organization-defined fail-safe procedures. | SI-17 | Policy Implemented in Parts 1.8.4 and 3.8. |
| CCI-002779 | The organization provides incident response training to information system users consistent with assigned roles and responsibilities when required by information system changes. | IR-2 b | Policy Implemented in Part 1.8.4. |
| CCI-002855 | The information system, when organization-defined conditions are detected, enters a safe mode of operation with organization-defined restrictions of safe mode of operation. | CP-12 | Implemented by Information System in Part 3.8. |
| CCI-002856 | The organization defines the conditions that, when detected, the information system enters a safe mode of operation with organization-defined restrictions of safe mode of operation. | CP-12 | Policy Implemented in Part 3.8. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**UMCS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002857 | The organization defines the restrictions of the safe mode of operation that the information system will enter when organization-defined conditions are detected. | CP-12 | Policy Implemented in Part 3.8. |
| CCI-002906 | The organization defines the vulnerability scanning activities in which the information system implements privileged access authorization to organization-identified information system components. | RA-5 (5) | Policy Implemented in Parts 2.3 and 3.11. |
| CCI-002926 | The organization defines the physical spaces containing one or more components of the information system that require physical access authorizations and controls at the facility where the information system resides. | PE-3 (1) | Policy Implemented in Part 3.3.6. |
| CCI-002930 | The organization defines information system distribution and transmission lines within organizational facilities to control physical access to using organization-defined security safeguards. | PE-4 | Policy Implemented in Part 3.3.6. |
| CCI-002931 | The organization defines security safeguards to control physical access to organization-defined information system distribution and transmission lines within organizational facilities. | PE-4 | Policy Implemented in Part 3.3.6. |
| CCI-002953 | The organization employs redundant power cabling paths that are physically separated by an organization-defined distance. | PE-9 (1) | Policy Implemented in Part 3.10. |
| CCI-002954 | The organization defines the distance by which to physically separate redundant power cabling paths. | PE-9 (1) | Policy Implemented in Part 3.10. |
| CCI-002955 | The organization provides a short-term uninterruptible power supply to facilitate an orderly shutdown of the information system and/or transition of the information system to long-term alternate power in the event of a primary power source loss. | PE-11 | Policy Implemented in Part 3.10. |

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-000765 | The information system implements multifactor authentication for network access to privileged accounts. | IA-2 (1), IA-2 (1).1 | Implemented by Information System in Part 3.4. |
| CCI-000768 | The information system implements multifactor authentication for local access to non-privileged accounts. | IA-2 (4), IA-2 (4).1 | Implemented by Information System in Part 3.4. |
| CCI-000777 | The organization defines a list of specific and/or types of devices for which identification and authentication is required before establishing a connection to the information system. | IA-3, IA-3.1 (i) | Policy Implemented in Part 3.2.7. |
| CCI-000778 | The information system uniquely identifies an organization-defined list of specific and/or types of devices before establishing a local, remote, or network connection. | IA-3, IA-3.1 (ii) | implemented by Information System in Part 3.2.7. |
| CCI-000779 | The information system authenticates devices before establishing remote network connections using bidirectional authentication between devices that is cryptographically based. | IA-3 (1), IA-3 (1).1 (i) | Implemented by Information System in Part 1.8.4. |
| CCI-000803 | The information system implements mechanisms for authentication to a cryptographic module that meet the requirements of applicable federal laws, Executive Orders, directives, policies, regulations, standards, and guidance for such authentication. | IA-7, IA-7.1 | Implemented by Information System in Part 3.2.8. |
| CCI-000865 | The organization approves information system maintenance tools. | MA-3, MA-3.1 (i) | Policy Implemented in Part 3.9. |
| CCI-000928 | The organization enforces physical access authorizations to the information system in addition to the physical access controls for the facility where the information system resides at organization-defined physical spaces containing one or more components of the information system. | PE-3 (1), PE-3 (1).1 | Policy Implemented in Part 3.3.6. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-000936 | The organization controls physical access to organization-defined information system distribution and transmission lines within organizational facilities using organization-defined security safeguards. | PE-4, PE-4.1 | Policy Implemented in Part 3.3.6. |
| CCI-000937 | The organization controls physical access to information system output devices to prevent unauthorized individuals from obtaining the output. | PE-5, PE5.1 | Policy Implemented in Part 3.3.6. |
| CCI-000952 | The organization protects power equipment and power cabling for the information system from damage and destruction. | PE-9, PE-9.1 | Policy Implemented in Part 3.10. |
| CCI-000961 | The organization provides a long-term alternate power supply for the information system that is capable of maintaining minimally required operational capability in the event of an extended loss of the primary power source. | PE-11 (1), PE-11 (1).1 | Policy Implemented in Part 3.10. |
| CCI-001054 | The organization scans for vulnerabilities in the information system and hosted applications on an organization-defined frequency. | RA-5 a, RA-5.1 (ii) | Policy Implemented in Part 3.11. |
| CCI-001055 | The organization defines a frequency for scanning for vulnerabilities in the information system and hosted applications. | RA-5 a, RA-5.1 (i) | Policy Implemented in Part 3.11. |
| CCI-001056 | The organization scans for vulnerabilities in the information system and hosted applications when new vulnerabilities potentially affecting the system/applications are identified and reported. | RA-5 a, RA-5.1 (iii) | Policy Implemented in Part 3.11. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-001057 | The organization employs vulnerability scanning tools and techniques that facilitate interoperability among tools and automate parts of the vulnerability management process by using standards for: enumerating platforms, software flaws, and improper configurations; formatting checklists and test procedures; and measuring vulnerability impact. | RA-5 b, RA-5.1 (iv) | Policy Implemented in Part 3.11. |
| CCI-001058 | The organization analyzes vulnerability scan reports and results from security control assessments. | RA-5 c, RA-5.1 (v) | Policy Implemented in Part 3.11. |
| CCI-001059 | The organization remediates legitimate vulnerabilities in organization-defined response times in accordance with an organizational assessment risk. | RA-5 d, RA-5.2 (ii) | Policy Implemented in Part 3.11. |
| CCI-001062 | The organization employs vulnerability scanning tools that include the capability to readily update the information system vulnerabilities to be scanned. | RA-5 (1), RA-5 (1).1 | Policy Implemented in Parts 2.3 and 3.11. |
| CCI-001067 | The information system implements privileged access authorization to organization-identified information system components for selected organization-defined vulnerability scanning activities. | RA-5 (5), RA-5 (5).1 (ii) | Implemented by Information System in Parts 2.3 and 3.11. |
| CCI-001082 | The information system separates user functionality (including user interface services) from information system management functionality. | SC-2, SC-2.1 | Implemented by Information System in Part 3.7.2. |
| CCI-001093 | The organization defines the types of denial of service attacks (or provides references to sources of current denial of service attacks) that can be addressed by the information system. | SC-5 | Policy Implemented in Part 3.7.2. |
| CCI-001094 | The information system restricts the ability of individuals to launch organization-defined denial of service attacks against other information systems. | SC-5 (1), SC-5 (1).1 | Implemented by Information System in Part 3.2.4. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-001095 | The information system manages excess capacity, bandwidth, or other redundancy to limit the effects of information flooding types of denial of service attacks. | SC-5 (2), SC-5 (2).1 | Implemented by Information System in Part 3.2.4. |
| CCI-001097 | The information system monitors and controls communications at the external boundary of the information system and at key internal boundaries within the system. | SC-7 a, SC-7.1 (iii) | Implemented by Information System in Parts 3.3.6, 3.7.2 and 3.7.5. |
| CCI-001098 | The information system connects to external networks or information systems only through managed interfaces consisting of boundary protection devices arranged in accordance with an organizational security architecture. | SC-7 b, SC-7.1 (iv), SC-7 (c) | Implemented by Information System in Part 3.7.5. |
| CCI-001102 | The organization implements a managed interface for each external telecommunication service. | SC-7 (4) (a), SC-7 (4).1 (ii) | Policy Implemented in Part 3.7.5. |
| CCI-001109 | The information system at managed interfaces denies network communications traffic by default and allows network communications traffic by exception (i.e., deny all, permit by exception). | SC-7 (5), SC-7 (5).1 (i) (ii) | Implemented by Information System in Parts 1.8.2, 3.3.6 and 3.7.5. |
| CCI-001119 | The organization isolates organization-defined information security tools, mechanisms, and support components from other internal information system components by implementing physically separate subnetworks with managed interfaces to other components of the system. | SC-7 (13), SC-7 (13).1 (ii) | Policy Implemented in Part 3.7.5. |
| CCI-001120 | The organization defines key information security tools, mechanisms, and support components to be isolated. | SC-7 (13), SC-7 (13).1 (iii) | Policy Implemented in Part 3.7.5. |
| CCI-001126 | The information system fails securely in the event of an operational failure of a boundary protection device. | SC-7 (18) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |

**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002105 | The organization documents, for each internal connection, the nature of the information communicated. | CA-9 (b) | Policy Implemented in Part 1.8.3. |
| CCI-002110 | The organization defines the information system account types that support the organizational missions/business functions. | AC-2 a | Policy Implemented in Part 3.3.1. |
| CCI-002130 | The information system automatically audits account enabling actions. | AC-2 (4) | Technical Implemented in Part 3.3.1. |
| CCI-002132 | The information system notifies organization-defined personnel or roles for account enabling actions. | AC-2 (4) | Technical Implemented in Part 3.3.1. |
| CCI-002221 | The organization defines the security-relevant information for which access must be explicitly authorized. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002222 | The organization explicitly authorizes access to organization-defined security functions. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002223 | The organization explicitly authorizes access to organization-defined security-relevant information. | AC-6 (1) | Policy Implemented in Parts 3.3.1 and 3.4. |
| CCI-002234 | The information system audits the execution of privileged functions. | AC-6 (9) | Implemented by Information System in Parts 3.3.1 and 3.4. |
| CCI-002235 | The information system prevents non-privileged users from executing privileged functions to include disabling, circumventing, or altering implemented security safeguards/countermeasures. | AC-6 (10) | Implemented by Information System in Parts 3.3.1 and 3.4. |
| CCI-002236 | The organization defines the time period the information system will automatically lock the account or node when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Policy Implemented in Part 3.3.2. |
| CCI-002237 | The organization defines the delay algorithm to be employed by the information system to delay the next logon prompt when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Policy Implemented in Part 3.3.2. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002238 | The information system automatically locks the account or node for either an organization-defined time period, until the locked account or node is released by an administrator, or delays the next logon prompt according to the organization-defined delay algorithm when the maximum number of unsuccessful logon attempts is exceeded. | AC-7 b | Implemented by Information System in Part 3.2. |
| CCI-002243 | The organization-defined information system use notification message or banner is to state that users are accessing a U.S. Government information system. | AC-8 a 1 | Policy Implemented in Part 3.3.3. |
| CCI-002244 | The organization-defined information system use notification message or banner is to state that information system usage may be monitored, recorded, and subject to audit. | AC-8 a 2 | Policy Implemented in Part 3.3.3. |
| CCI-002245 | The organization-defined information system use notification message or banner is to state that unauthorized use of the information system is prohibited and subject to criminal and civil penalties. | AC-8 a 3 | Policy Implemented in Part 3.3.3. |
| CCI-002246 | The organization-defined information system use notification message or banner is to state that use of the information system indicates consent to monitoring and recording. | AC-8 a 4 | Policy Implemented in Part 3.3.3. |
| CCI-002247 | The organization defines the use notification message or banner the information system displays to users before granting access to the system. | AC-8 a | Policy Implemented in Part 3.3.3. |
| CCI-002248 | The organization defines the conditions of use which are to be displayed to users of the information system before granting further access. | AC-8 c 1 | Policy Implemented in Part 3.3.3. |
| CCI-002252 | The organization defines the accounts and/or account types for which the information system will limit the number of concurrent sessions. | AC-10 | Policy Implemented in Parts 3.2.2 and 3.3.4. |

**TURKEY CREEK FIRE SUPPORT STATION**
**FORT CARSON, CO**
**CONFIGURABLE SYSTEMS CCI LIST**

| CCI | DEFINITION | SECURITY CONTROLS | SPECIFICATION REFERENCE |
|---|---|---|---|
| CCI-002323 | The organization establishes configuration/connection requirements for wireless access. | AC-18 a | Policy Implemented in Part 3.3.1. |
| CCI-002360 | The organization defines the conditions or trigger events requiring session disconnect to be employed by the information system when automatically terminating a user session. | AC-12 | Policy Implemented in Part 3.3.4. |
| CCI-002361 | The information system automatically terminates a user session after organization-defined conditions or trigger events requiring session disconnect. | AC-12 | Implemented by Information System in Part 3.3.4. |
| CCI-002385 | The information system protects against or limits the effects of organization-defined types of denial of service attacks by employing organization-defined security safeguards. | SC-5 | Implemented by Information System in Part 3.7.2. |
| CCI-002386 | The organization defines the security safeguards to be employed to protect the information system against, or limit the effects of, denial of service attacks. | SC-5 | Policy Implemented in Part 3.7.2. |
| CCI-002396 | The organization protects the confidentiality and integrity of the information being transmitted across each interface for each external telecommunication service. | SC-7 (4) (c) | Policy Implemented in Part 3.7.5. |
| CCI-002397 | The information system, in conjunction with a remote device, prevents the device from simultaneously establishing non-remote connections with the system and communicating via some other connection to resources in external networks. | SC-7 (7) | Implemented by Information System in Part 3.7.5. |
| CCI-002398 | The information system detects outgoing communications traffic posing a threat to external information systems. | SC-7 (9) (a) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |
| CCI-002399 | The information system denies outgoing communications traffic posing a threat to external information systems. | SC-7 (9) (a) | Implemented by Information System in Parts 1.8.2 and 3.7.5. |

3.4.8 Fabrication
3.4.9 Placing Reinforcement
3.4.10 Spacing of Reinforcing Bars
3.4.11 Concrete Protection for Reinforcement
3.4.12 Welding
3.5 BATCHING, MEASURING, MIXING, AND TRANSPORTING CONCRETE
3.5.1 Measuring
3.5.2 Mixing
3.5.3 Transporting
3.6 PLACING CONCRETE
3.6.1 Pumping
3.6.2 Cold Weather
3.6.3 Hot Weather
3.6.4 Bonding
3.7 WASTE MANAGEMENT
3.7.1 Mixing Equipment
3.7.2 Hardened, Cured Waste Concrete
3.7.3 Reinforcing Steel
3.7.4 Other Waste
3.8 SURFACE FINISHES EXCEPT FLOOR, SLAB, AND PAVEMENT FINISHES
3.8.1 Defects
3.8.2 Not Against Forms (Top of Walls)
3.8.3 Formed Surfaces
3.8.3.1 Tolerances
3.8.3.2 As-Cast Rough Form
3.8.3.3 Standard Smooth Finish
3.9 FLOOR, SLAB, AND PAVEMENT FINISHES AND MISCELLANEOUS CONSTRUCTION
3.9.1 Finish
3.9.1.1 Scratched
3.9.1.2 Floated
3.9.1.3 Steel Troweled
3.9.1.4 Broomed
3.9.1.5 Pavement
3.9.1.6 Liquid Chemical Floor Sealer
3.9.2 Flat Floor Finishes
3.9.2.1 Measurement of Floor Tolerances
3.9.2.2 Remedies for Out of Tolerance Work
3.9.3 Trench Drains
3.9.4 Splash Blocks
3.10 JOINTS
3.10.1 Construction Joints
3.10.1.1 Maximum Allowable Construction Joint Spacing
3.10.1.2 Construction Joints for Constructability Purposes
3.10.2 Isolation Joints in Slabs on Ground

3.10.3 Contraction Joints in Slabs on Ground
3.10.4 Sealing Joints in Slabs on Ground
3.11 CURING AND PROTECTION
3.11.1 Requirements for Type III, High-Early-Strength Portland Cement
3.11.2 Curing Periods
3.11.3 Curing Formed Surfaces
3.11.4 Curing Unformed Surfaces
3.11.5 Temperature of Concrete During Curing
3.11.6 Protection from Mechanical Injury
3.11.7 Protection After Curing
3.12 FIELD QUALITY CONTROL
3.12.1 Sampling
3.12.2 Testing
3.12.2.1 Slump Tests
3.12.2.2 Temperature Tests
3.12.2.3 Compressive Strength Tests
3.12.2.4 Air Content
3.12.2.5 Unit Weight of Structural Concrete
3.12.2.6 Chloride Ion Concentration
3.12.2.7 Strength of Concrete Structure
3.12.2.8 Non-Conforming Materials
3.12.2.9 Testing Concrete Structure for Strength
3.13 REPAIR, REHABILITATION AND REMOVAL
3.13.1 Repair of Weak Surfaces
3.13.2 Failure of Quality Assurance Test Results

1.2 DEFINITIONS

a. "Cementitious material" as used herein must include all portland cement, pozzolan, fly ash, slag cement.

b. "Exposed to public view" means situated so that it can be seen from eye level from a public location after completion of the building. A public location is accessible to persons not responsible for operation or maintenance of the building.

c. "Chemical admixtures" are materials in the form of powder or fluids that are added to the concrete to give it certain characteristics not obtainable with plain concrete mixes.

d. "Supplementary cementing materials" (SCM) include coal fly ash, silica

fume, slag cement, natural or calcined pozzolans, and ultra-fine coal ash when used in such proportions to replace the portland cement that result in improvement to sustainability and durability and reduced cost.

e. "Design strength" (f'c) is the specified compressive strength of concrete at time(s) specified in this section to meet structural design criteria.

f. "Mass Concrete" is any concrete system that approaches a maximum temperature of 158 degrees F within the first 72 hours of placement. In addition, it includes all concrete elements with a section thickness of 3 feet or more regardless of temperature.

g. "Mixture proportioning" is the process of designing concrete mixture proportions to enable it to meet the strength, service life and constructability requirements of the project while minimizing the initial and life-cycle cost.

h. "Mixture proportions" are the masses or volumes of individual ingredients used to make a unit measure (cubic meter or cubic yard) of concrete.

i. "Pozzolan" is a siliceous or siliceous and aluminous material, which in itself possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties.

j. "Workability (or consistence)" is the ability of a fresh (plastic) concrete mix to fill the form/mould properly with the desired work (vibration) and without reducing the concrete's quality. Workability depends on water content, chemical admixtures, aggregate (shape and size distribution), cementitious content and age (level of hydration).

## 1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Concrete Curing Plan

Quality Control Plan; G,RO

Quality Control Personnel Certifications; G, RO

Quality Control Organizational Chart

Laboratory Accreditation; G, RO

Form Removal Schedule; G, RO

Maturity Method Data

SD-02 Shop Drawings

Formwork; G, RO

Reinforcing Steel; G, RO

SD-03 Product Data

Joint Sealants; (LEED NC)

Joint Filler; (LEED NC)

Formwork Materials

Recycled Aggregate Materials; (LEED NC)

Curing Compound

1.4 MODIFICATION OF REFERENCES

Accomplish work in accordance with ACI publications except as modified herein. Consider the advisory or recommended provisions to be mandatory. Interpret reference to the "Building Official," the "Structural Engineer," and the "Architect/Engineer" to mean the Contracting Officer.

1.5 DELIVERY, STORAGE, AND HANDLING

Follow ACI 301, ACI 304R and ASTM A934/A934M requirements and recommendations. Do not deliver concrete until vapor barrier, forms, reinforcement, embedded items, and chamfer strips are in place and ready for concrete placement. Do not store concrete curing compounds or sealers with materials that have a high capacity to adsorb volatile organic compound (VOC) emissions. Do not store concrete curing compounds or sealers in occupied spaces.

1.5.1 Reinforcement

Store reinforcement of different sizes and shapes in separate piles or racks raised above the ground to avoid excessive rusting. Protect from contaminants such as grease, oil, and dirt. Ensure bar sizes can be accurately identified after bundles are broken and tags removed.

## 1.6 QUALITY ASSURANCE

### 1.6.1 Design Data

#### 1.6.1.1 Formwork Calculations

ACI 347R. Include design calculations for shoring of elevated structural floor slabs, indicating arrangement of forms, sizes and grades of supports (lumber), and related components. Furnish drawings and calculations of shoring and re-shoring methods proposed for floor slabs. Calculations must indicate concrete pressure with both live and dead loads, along with material types.

#### 1.6.1.2 Concrete Mix Design

Sixty days minimum, prior to concrete placement, submit a mix design for each strength and type of concrete. Submit a complete list of materials including type; brand; source and amount of cement, supplementary cementitious materials, and admixtures; and applicable reference specifications. Submit mill test and all other test for cement, supplementary cementitious materials, aggregates, and admixtures. Provide documentation of maximum nominal aggregate size, gradation analysis, percentage retained and passing sieve, and a graph of percentage retained verses sieve size. Provide mix proportion data using at least three different water-cementitious material ratios for each type of mixture, which produce a range of strength encompassing those required for each type of concrete required. If source material changes, resubmit mix proportion data using revised source material. Provide only materials that have been proven by trial mix studies to meet the requirements of this specification, unless otherwise approved in writing by the Contracting Officer. Indicate clearly in the submittal where each mix design is used when more than one mix design is submitted. Resubmit data on concrete components if the qualities or source of components changes. For previously approved concrete mix designs used within the past twelve months, the previous mix design may be re-submitted without further trial batch testing if accompanied by material test data conducted within the last six months. Obtain mix design approval from the contracting officer prior to concrete placement.

### 1.6.2 Shop Drawings

#### 1.6.2.1 Formwork

Drawings showing details of formwork for foundation walls, including, but not limited to; joints, supports, studding and shoring, and sequence of form and shoring removal. Indicate placement schedule, construction, location and method of forming control joints. Include locations of inserts, conduit, sleeves and other embedded items. Reproductions of contract drawings are unacceptable. Submit form removal schedule indicating element and minimum length of time for form removal.

#### 1.6.2.2 Reinforcing Steel

Indicate bending diagrams, assembly diagrams, splicing and laps of bars, shapes, dimensions, and details of bar reinforcing, accessories, and concrete cover. Do not scale dimensions from structural drawings to determine lengths of reinforcing bars. Reproductions of contract drawings are unacceptable.

1.6.3 Control Submittals

1.6.3.1 Concrete Curing Plan

Submit proposed materials, methods and duration for curing concrete elements in accordance with ACI 308.1.

1.6.3.2 Pumping Concrete

Submit proposed materials and methods for pumping concrete, if used as a placement method. Submittal must include mix designs, pumping equipment including type of pump and size and material for pipe, and maximum length and height concrete is to be pumped.

1.6.3.3 Finishing Plan

Submit proposed material and procedures to be used in obtaining the surface finish for the Apparatus Bay floors.

1.6.3.4 Safety Data Sheets

Submit Safety Data Sheets (SDS) for all materials that are regulated for hazardous health effects. SDS must be readily accessible during each work shift to employees when they are at the construction site.

1.6.4 Test Reports

1.6.4.1 Fly Ash and Pozzolan

Submit test results in accordance with ASTM C618 for fly ash and pozzolan. Submit test results performed within 6 months of submittal date.

1.6.4.2 Aggregates

Submit test results in accordance with ASTM C33/C33M, and ASTM C1293 or ASTM C1567 as required in the paragraph titled ALKALI-AGGREGATE REACTION.

1.6.5 Field Samples

1.6.5.1 Slab Finish Samples

Install a minimum of a 10 foot by 10 foot slab for each of the three broom finish choices of the Apparatus Bay and Work Room. Slab finish samples must not be part of the final project. Finish as required by specification for selection of the degree of broom application to be used in the project.

1.6.6 Quality Control Plan

Develop and submit for approval a concrete quality control program in accordance with the guidelines of ACI 121R and as specified herein. The plan must include approved laboratories. Provide direct oversight for the concrete qualification program inclusive of associated sampling and testing. All quality control reports must be provided to the Contracting Officer, Quality Manager and Concrete Supplier. Maintain a copy of ACI SP-15 and CRSI 10MSP at project site.

1.6.7 Quality Control Personnel Certifications

The Contractor must submit for approval the responsibilities of the various quality control personnel, including the names and qualifications of the individuals in those positions and a quality control organizational chart defining the quality control hierarchy and the responsibility of the various positions. Quality control personnel must be employed by the Contractor.

Submit American Concrete Institute certification for the following:

a. CQC personnel responsible for inspection of concrete operations.

b. Lead Foreman or Journeyman of the Concrete Placing, Finishing, and Curing Crews.

c. Field Testing Technicians: ACI Concrete Field Testing Technician, Grade I.

1.6.7.1 Field Testing Technician and Testing Agency

Submit data on qualifications of proposed testing agency and technicians for approval by the Contracting Officer prior to performing testing on concrete.

a. Work on concrete under this contract must be performed by an ACI Concrete Field Testing Technician Grade 1 qualified in accordance with ACI SP-2 or equivalent. Equivalent certification programs must include requirements for written and performance examinations as stipulated in ACI SP-2.

b. Testing agencies that perform testing services on reinforcing steel must meet the requirements of ASTM E329.

c. Testing agencies that perform testing services on concrete materials must meet the requirements of ASTM C1077.

1.6.8 Laboratory Qualifications for Concrete Qualification Testing

The concrete testing laboratory must have the necessary equipment and experience to accomplish required testing. The laboratory must meet the requirements of ASTM C1077 and be Cement and Concrete Reference Laboratory (CCRL) inspected.

1.6.9 Laboratory Accreditation

Laboratory and testing facilities must be provided by and at the expense of the Contractor. The laboratories performing the tests must be accredited in accordance with ASTM C1077, including ASTM C78/C78M and ASTM C1260. The accreditation must be current and must include the required test methods, as specified. Furthermore, the testing must comply with the following requirements:

a. Aggregate Testing and Mix Proportioning: Aggregate testing and mixture proportioning studies must be performed by an accredited laboratory and under the direction of a registered professional engineer in a U.S. state or territory who is competent in concrete materials and must sign all reports and designs.

b. Acceptance Testing: Furnish all materials, labor, and facilities required for molding, curing, testing, and protecting test specimens at the site and in the laboratory. Furnish and maintain boxes or other facilities suitable for storing and curing the specimens at the site while in the mold within the temperature range stipulated by ASTM C31/C31M.

c. Contractor Quality Control: All sampling and testing must be performed by an approved, onsite, independent, accredited laboratory.

1.7 SUSTAINABLE DESIGN REQUIREMENTS

1.7.1 Local/Regional Materials

See Section 01 33 29 SUSTAINABILITY REPORTING for cumulative total local material requirements. Concrete materials may be locally available.

1.8 QUALIFICATIONS FOR WELDING WORK

Welding procedures must be in accordance with AWS D1.4/D1.4M.

Verify that Welder qualifications are in accordance with AWS D1.4/D1.4M for welding of reinforcement or under an equivalent qualification test approved in advance. Welders are permitted to do only the type of welding for which each is specifically qualified.

PART 2 PRODUCTS

2.1 FORMWORK MATERIALS

a. Form-facing material in contact with concrete must be lumber, plywood, tempered concrete-form-grade hardboard, metal, plastic, or treated paper that creates specified appearance and texture of concrete surface. Submit product information on proposed form-facing materials if different from that specified herein.

b. Design formwork, shores, reshores, and backshores to support loads transmitted to them and to comply with applicable building code requirements.

d. Design formwork to withstand pressure resulting from placement and vibration of concrete and to maintain specified tolerances.

e. Design formwork to accommodate waterstop materials in joints at locations indicated in Contract Documents.

f. Provide temporary openings in formwork if needed to facilitate cleaning and inspection.

g. Design formwork joints to inhibit leakage of mortar.

h. Limit deflection of facing materials for concrete surfaces exposed to view to 1/240of center-to-center spacing of facing supports.

i. Do not use earth cuts as forms for vertical or sloping surfaces.

j. Submit product information on proposed form-facing materials if different from that specified herein.

k. Submit shop drawings for formwork, shoring, reshoring, and backshoring.

l. Submit design calculations for formwork, shoring, reshoring, and backshoring for structural elevated slabs. Design calculations for shoring of structural elevated slabs must be signed and sealed by a licensed design engineer.

n. Submit manufacturer's product data on form liner proposed for use with each formed surface.

2.1.1 Wood Forms

Use lumber as specified in Section 06 10 00 ROUGH CARPENTRY and as follows. Provide lumber that is square edged or tongue-and-groove boards, free of raised grain, knotholes, or other surface defects. Provide plywood that complies with NIST PS 1, B-B concrete form panels or better or AHA A135.4, hardboard for smooth form lining.

2.1.1.1 Concrete Form Plywood (Standard Rough)

Provide plywood that conforms to NIST PS 1, B-B, concrete form, not less than 5/8-inch thick.

2.1.1.2 Overlaid Concrete Form Plywood (Standard Smooth)

Provide plywood that conforms to NIST PS 1, B-B, high density form overlay, not less than 5/8-inch thick.

2.1.2 Plastic Forms

Plastic lumber as specified in Section 06 10 00 ROUGH CARPENTRY. Provide plastic forms that contain a minimum of 50 percent post-consumer recycled content, or a minimum of 50 percent post-industrial recycled content.

2.1.3 Carton Forms for Voids Under Slabs

Moisture resistant treated paper faces, biodegradable, structurally sufficient to support weight of wet concrete until initial set. Provide carton forms that contain a minimum of 5 percent post-consumer recycled content, or a minimum of 20percent post-industrial recycled content.

2.1.4 Steel Forms

Provide steel form surfaces that do not contain irregularities, dents, or sags.

2.2 FORMWORK ACCESSORIES

a. Use commercially manufactured formwork accessories, including ties and hangers.

b. Form ties and accessories must not reduce the effective cover of the reinforcement.

2.2.1 Form Ties

a. Use form ties with ends or end fasteners that can be removed without damage to concrete.

b. Where indicated in Contract Documents, use form ties with integral water barrier plates or other acceptable positive water barriers in walls.

c. The breakback distance for ferrous ties must be as defined in ACI 301.

d. If the breakback distance is less than 3/4 in., use coated or corrosion-resistant ties.

e. Submit manufacturer's data sheet on form ties.

2.2.2 Biodegradable Form Release Agent

a. Provide form release agent that is colorless, biodegradable

b. Provide product that does not bond with, stain, or adversely affect concrete surfaces and does not impair subsequent treatments of concrete surfaces.

c. Provide form release agent that reduces formwork moisture absorption, and does not contain diesel fuel, petroleum-based lubricating oils, waxes, or kerosene.

d. Submit manufacturer's product data on formwork release agent for use on each form-facing material.

2.2.3 Chamfer Materials

Use lumber materials with dimensions of 3/4 x 3/4 in.

2.2.4 Construction and movement joints

a. Submit details and locations of construction joints in accordance with the requirements herein.

b. Locate construction joints within middle one-third of spans of slabs.

c. Locate construction joints in walls and piers at underside of slabs and at tops of footings or slabs, unless indicated otherwise.

d. Make construction joints perpendicular to main reinforcement.

e. Provide movement joints where indicated in Contract Documents or in accepted alternate locations.

f. Submit location and detail of movement joints if different from those indicated in Contract Documents.

g. Submit manufacturer's data sheet on expansion joint materials.

2.2.5 Perimeter Insulation

Perimeter insulation must be polystyrene conforming to ASTM C578, Type II; polyurethane conforming to ASTM C591, Type II; or cellular glass conforming to ASTM C552, Type I or IV. Comply with EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING.

2.2.6 Other Embedded items

Use sleeves, inserts, anchors, and other embedded items of material and design indicated in Contract Documents.

2.3 CONCRETE MATERIALS

2.3.1 Cementitious Materials

2.3.1.1 Portland Cement

a. Unless otherwise specified, provide cement that conforms to ASTM C150/C150M Type I or III.

b. Use one brand and type of cement for formed concrete having exposed-to-view finished surfaces.

c. For portland cement manufactured in a kiln fueled by hazardous waste, maintain a record of source for each batch.

d. Submit information along with evidence demonstrating compliance with referenced standards. Submittals must include types of cementitious materials, manufacturing locations, shipping locations, and certificates showing compliance.

e. Cementitious materials must be stored and kept dry and free from contaminants.

2.3.1.2 Fly Ash

a. ASTM C618, Class F, except that the maximum allowable loss on ignition must not exceed 3 percent.

b. Fly ash content must be a minimum of 15 percent by weight of cementitious material, provided the fly ash does not reduce the amount of cement in the concrete mix below the minimum requirements of local building codes. Where the use of fly ash cannot meet the minimum level, provide the maximum amount of fly ash permittable that meets the code requirements for cement content. Report the chemical analysis of the fly ash in accordance with ASTM C311/C311M. Evaluate and classify fly ash in accordance with ASTM D5759.

2.3.1.3 Other Supplementary Cementitious Materials

Natural pozzolan must be raw or calcined and conform to ASTM C618, Class N, including the optional requirements for uniformity and effectiveness in controlling ASR and must have an ignition loss not exceeding 3 percent. Class N pozzolan for use in mitigating ASR must have a Calcium Oxide (CaO) content of less than 13 percent and total equivalent alkali content less than 3 percent.

Ultra Fine Fly Ash (UFFA) and Ultra Fine Pozzolan (UFP) must conform to ASTM C618, Class F or N, and the following additional requirements:

a. The strength activity index at 28 days of age must be at least 95 percent of the control specimens.

b. The average particle size must not exceed 6 microns.

c. The sum of $SiO_2$ + $Al_2O_3$ + $Fe_2O_3$ must be greater than 77 percent.

2.3.2 Water

a. Water or ice must comply with the requirements of ASTM C1602/C1602M.

b. Minimize the amount of water in the mix. Improve workability by adjusting the grading of the aggregate and using admixture rather than by adding water.

c. Water must be potable ; free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances deleterious to concrete.

d. Protect mixing water and ice from contamination during storage and delivery.

e. Submit test report showing water complies with ASTM C1602/C1602M.

f. When nonpotable source is proposed for use, submit documentation on effects of water on strength and setting time in compliance with ASTM C1602/C1602M.

2.3.3 Aggregate

2.3.3.1 Normal-Weight Aggregate

a. Aggregates must conform to ASTM C33/C33M unless otherwise specified in the Contract Documents or approved by the contracting officer.

b. Aggregates used in concrete must be obtained from the same sources and have the same size range as aggregates used in concrete represented by submitted field test records or used in trial mixtures.

c. Provide sand that is at least 50 percent natural sand.

d. Store and handle aggregate in a manner that will avoid segregation and prevents contamination by other materials or other sizes of aggregates. Store aggregates in locations that will permit them to drain freely. Do not use aggregates that contain frozen lumps.

e. Submit types, pit or quarry locations, producers' names, aggregate supplier statement of compliance with ASTM C33/C33M, and ASTM C1293 expansion data not more than 18 months old.

2.3.3.2 Recycled Aggregate Materials

Use a minimum of 25 percent recycled aggregate, Submit recycled material request with the aggregate certification submittals and do not use until approved by the Contracting Officer.

2.3.4 Admixtures

a. Chemical admixtures must conform to ASTM C494/C494M.

b. Air-entraining admixtures must conform to ASTM C260/C260M.

c. Chemical admixtures for use in producing flowing concrete must conform

to ASTM C1017/C1017M.

d. Do not use calcium chloride admixtures

f. Admixtures used in concrete must be the same as those used in the concrete represented by submitted field test records or used in trial mixtures.

g. Protect stored admixtures against contamination, evaporation, or damage.

h. To ensure uniform distribution of constituents, provide agitating equipment for admixtures used in the form of suspensions or unstable solutions. Protect liquid admixtures from freezing and from temperature changes that would adversely affect their characteristics.

i. Submit types, brand names, producers' names, manufacturer's technical data sheets, and certificates showing compliance with standards required herein.

## 2.4 MISCELLANEOUS MATERIALS

### 2.4.1 Concrete Curing Materials

Provide concrete curing material in accordance with ACI 301 Section 5 and ACI 308.1 Section 2. Membrane forming curing compound, where used, shall conform to ASTM C1315, Type I, Class A. Submit product data for concrete curing compounds. Submit manufactures instructions for placement of curing compound.

### 2.4.2 Nonshrink Grout

Nonshrink grout in accordance with ASTM C1107/C1107M.

### 2.4.3 Floor Finish Materials

#### 2.4.3.1 Liquid Chemical Floor Sealers

Deep Penetrating Concrete Sealer must be deep penetrating into the concrete that chemically reacts, expands inside the pores and cures as a silicate mineral. Once cured the concrete will be sealed permanently against water seepage, efflorescence and water vapor. The sealer shall not change the appearance or slip resistance of the concrete. Sealer shall not require reapplication over time. Submit the manufactures instructions for the application of the floor sealer. Product shall be similar to or equal to Diamond Hard, Lithium Densifier and Waterproofing sealer WB244.

### 2.4.4 Expansion/Contraction Joint Filler

ASTM D1751 Type I . Material must be 1/2 inch thick, unless otherwise indicated.

### 2.4.5 Joint Sealants

#### 2.4.5.1 Horizontal Surfaces, 3 Percent Slope, Maximum

ASTM D6690 or ASTM C920, Type M, Class 25, Use T.

2.4.5.2 Vertical Surfaces Greater Than 3 Percent Slope

ASTM C920, Type M, Grade NS, Class 25, Use T .

2.4.5.3 Preformed Polychloroprene Elastomeric Type

ASTM D2628.

2.4.6 Vapor Retarder

ASTM E1745 Class A polyolefin sheeting, minimum15 mil thickness, or other equivalent material with a maximum permeance rating of 0.01 perms per ASTM E96/E96M.

2.4.7 Dovetail Anchor Slot

Preformed metal slot approximately 1 inch by 1 inch of not less than 22 gage galvanized steel cast in concrete. Coordinate actual size and throat opening with dovetail anchors and provide with removable filler material. Dovetail anchors are to be used to attach stone veneer to concrete wall surfaces.

2.5 CONCRETE MIX DESIGN

2.5.1 Properties and Requirements

a. Use materials and material combinations listed in this section and the contract documents.

b. Cementitious material content must be adequate for concrete to satisfy the specified requirements for strength, w/cm, durability, and finishability described in this section and the contract documents.

The minimum cementitious material content for concrete used in floors shall be 520 pounds per cubic yard.

c. Selected target slump must meet the requirements this section, the contract documents, and must not exceed 9 in. Concrete must not show visible signs of segregation.

d. The target slump must be enforced for the duration of the project. Determine the slump by ASTM C143/C143M. Slump tolerances must meet the requirements of ACI 117.

e. The nominal maximum size of coarse aggregate for a mixture must not exceed three-fourths of the minimum clear spacing between reinforcement, one-fifth of the narrowest dimension between sides of forms, or one-third of the thickness of slabs or toppings.

f. All concrete wall, exterior slab and foundation elements in this project shall be considered Exposure Class F2, for freeze/thaw durability, in accordance with ACI 318, and shall be air entrained unless otherwise noted or specified. Other interior concrete work shall be considered Exposure Class F0. The total air content must be in accordance with the requirements of the paragraph titled DURABILITY.

g. Measure air content at the point of delivery in accordance with ASTM C173/C173M or ASTM C231/C231M.

i. Concrete properties and requirements for each portion of the structure are specified in the table below. Refer to the paragraph titled DURABILITY for more details on exposure categories and their requirements.

| | **Minimum $f'c$ psi** | **Miscellaneous Requirements** |
|---|---|---|
| All concrete | 4500 at 28 days | Nominal maximum aggregate size must be 1 in. |

2.5.2 Durability

2.5.2.1 Alkali-Aggregate Reaction

Do not use any aggregate susceptible to alkali-carbonate reaction (ACR). Use one of the three options below for qualifying concrete mixtures to reduce the potential of alkali-silica reaction (ASR):

a. For each aggregate used in concrete, the expansion result determined in accordance with ASTM C1293 must not exceed 0.04 percent at one year.

b. For each aggregate used in concrete, the expansion result of the aggregate and cementitious materials combination determined in accordance with ASTM C1567 must not exceed 0.10 percent at an age of 16 days.

c. Alkali content in concrete (LBA) must not exceed 4 pounds per cubic yard for moderately reactive aggregate or 3 pounds per cubic yard for highly reactive aggregate. Reactivity must be determined by testing in accordance with ASTM C1293 and categorized in accordance with ASTM C1778. Alkali content is calculated as follows:
LBA = (cement content, pounds per cubic yard) × (equivalent alkali content of portland cement in percent/100 percent)

2.5.2.2 Freezing and Thawing Resistance

a. Concrete for Exposure Class F2 shall have a maximum water/cement ratio of 0.45.

b. Concrete for Exposure Class F2 shall be air entrained. The total air content shall be 6 percent for Exposure Class F2 concrete. Tolerance on air content as delivered shall be plus/minus 1.5 percent.

c. Submit documentation verifying compliance with specified requirements.

2.5.2.3 Corrosion and Chloride Content

a. The floor slab of the Apparatus Bay shall be considered Exposure Class C2 for corrosion resistance, in accordance with ACI 318. All other concrete shall be considered Class C0. Provide concrete having a maximum water/cement ratio of 0.4 and a maximum water-soluble chloride ion (CL-) content in concrete, by mass of cement, of 0.15 for Class C2

elements. There are no specific corrosion chloride content limits for Class C0 concrete.

b. Submit documentation verifying compliance with specified requirements for Class C2 concrete.

c. Water-soluble chloride ion content contributed from constituents including water, aggregates, cementitious materials, and admixtures must be determined for the concrete mixture by ASTM C1218/C1218M at age between 28 and 42 days.

2.5.2.4 Sulfate Resistance

Specific sulfate resistance provisions are not required for concrete for this project.

2.5.2.5 Concrete Temperature

The temperature of concrete as delivered must not exceed 95°F .

2.5.2.6 Concrete permeability

a. All concrete work shall be considered Exposure Class W0. There are no specific material limitations related to Exposure Class W0.

b. Submit documentation verifying compliance with specified requirements.

2.5.3 Trial Mixtures

Trial mixtures must be in accordance to ACI 301.

2.5.4 Ready-Mix Concrete

Provide concrete that meets the requirements of ASTM C94/C94M.

Ready-mixed concrete manufacturer must provide duplicate delivery tickets with each load of concrete delivered. Provide delivery tickets with the following information in addition to that required by ASTM C94/C94M:

a. Type and brand cement

b. Cement and supplementary cementitious materials content in 94-pound bags per cubic yard of concrete

c. Maximum size of aggregate

d. Amount and brand name of admixtures

e. Total water content expressed by water cementitious material ratio

2.6 REINFORCEMENT

a. Bend reinforcement cold. Fabricate reinforcement in accordance with fabricating tolerances of ACI 117.

b. When handling and storing coated reinforcement, use equipment and methods that do not damage the coating. If stored outdoors for more than 2 months, cover coated reinforcement with opaque protective material.

c. Submit manufacturer's certified test report for reinforcement.

d. Submit placing drawings showing fabrication dimensions and placement locations of reinforcement and reinforcement supports. Placing drawings must indicate locations of splices, lengths of lap splices, and details of mechanical and welded splices.

e. Submit request with locations and details of splices not indicated in Contract Documents.

f. Submit request to place column dowels without using templates.

g. Submit request and procedure to field-bend or straighten reinforcing bars partially embedded in concrete at locations not indicated in Contract Documents.

h. Submit request for field cutting, including location and type of bar to be cut and reason field cutting is required.

2.6.1 Reinforcing Bars

a. Reinforcing bars must be deformed, except spirals, load-transfer dowels, and welded wire reinforcement, which may be plain.

b. ASTM A615/A615M with the bars marked A, Grade 60 ; or ASTM A996/A996M with the bars marked R, Grade 60, or marked A, Grade 60.

c. Reinforcing bars may contain post-consumer or post-industrial recycled content. Submit documentation indicating percentage of post-industrial and post-consumer recycled content per unit of product. Indicate relative dollar value of recycled content products to total dollar value of products included in project.

d. Submit mill certificates for reinforcing bars.

2.6.1.1 Bar Mats

a. Bar mats must conform to ASTM A184/A184M.

2.6.1.2 Headed Shear Stud Reinforcement

Headed studs and headed stud assemblies must conform to ASTM A1044/A1044M.

2.6.2 Mechanical Reinforcing Bar Connectors

a. Provide 125 percent minimum yield strength of the reinforcement bar.

b. Submit data on mechanical splices demonstrating compliance with this paragraph.

2.6.3 Wire

a. Provide flat sheets of welded wire reinforcement for slabs and toppings.

b. Plain or deformed steel wire must conform to ASTM A1064/A1064M.

2.6.4 Welded wire reinforcement

a. Use welded wire reinforcement specified in Contract Documents and conforming to one or more of the specifications given herein.

b. Plain welded wire reinforcement must conform to ASTM A1064/A1064M, with welded intersections spaced no greater than 12 in. apart in direction of principal reinforcement.

c. Deformed welded wire reinforcement must conform to ASTM A1064/A1064M, with welded intersections spaced no greater than 16 in. apart in direction of principal reinforcement.

2.6.5 Reinforcing Bar Supports

a. Reinforcing bar supports of precast concrete blocks, plastic coated steel fabricated with bearing plates, or specifically designed wire-fabric supports fabricated of plastic shall support the reinforcing steel and welded wire fabric adequately to remain in the designated locations during concrete placement. Precast concrete blocks shall not be used to support Welded wire fabric. Reinforcement supports shall conform to CRSI RB4.1.

b. Legs of supports in contact with formwork must be hot-dip galvanized, or plastic coated after fabrication, or stainless-steel bar supports.

2.6.6 Dowels for Load Transfer in Floors

Provide greased dowels for load transfer in floors of the type, design, weight, and dimensions indicated. Provide dowel bars that are plain-billet steel conforming to ASTM A615/A615M, Grade 40.

2.6.7 Welding

a. Provide weldable reinforcing bars that conform to ASTM A706/A706M and ASTM A615/A615M and Supplement S1, Grade 60, except that the maximum carbon content must be 0.55 percent.

b. Comply with AWS D1.4/D1.4M unless otherwise specified. Do not tack weld reinforcing bars.

c. Welded assemblies of steel reinforcement produced under factory conditions, such as welded wire reinforcement, bar mats, and deformed bar anchors, are allowed.

PART 3 EXECUTION

3.1 EXAMINATION

a. Do not begin installation until substrates have been properly constructed; verify that substrates are level.

b. If substrate preparation is the responsibility of another installer,

notify Contracting Officer of unsatisfactory preparation before processing.

c. Check field dimensions before beginning installation. If dimensions vary too much from design dimensions for proper installation, notify Contracting Officer and wait for instructions before beginning installation.

3.2 PREPARATION

Determine quantity of concrete needed and minimize the production of excess concrete. Designate locations or uses for potential excess concrete before the concrete is poured.

3.2.1 General

a. Surfaces against which concrete is to be placed must be free of debris, loose material, standing water, snow, ice, and other deleterious substances before start of concrete placing.

b. Remove standing water without washing over freshly deposited concrete. Divert flow of water through side drains provided for such purpose.

3.2.2 Subgrade Under Foundations and Footings

a. When subgrade material is semi-porous and dry, sprinkle subgrade surface with water as required to eliminate suction at the time concrete is deposited, or seal subgrade surface by covering surface with specified vapor retarder.

b. When subgrade material is porous, seal subgrade surface by covering surface with specified vapor retarder.

3.2.3 Subgrade Under Slabs on Ground

a. Before construction of slabs on ground, have underground work on pipes and conduits completed and approved.

b. Previously constructed subgrade or fill must be cleaned of foreign materials

c. Finish surface of capillary water barrier under interior slabs on ground must not show deviation in excess of 1/4 inch when tested with a 10-foot straightedge parallel with and at right angles to building lines.

d. Finished surface of subgrade or fill under exterior slabs on ground must not be more than 0.02-foot above or 0.10-foot below elevation indicated.

3.2.4 Edge Forms and Screed Strips for Slabs

a. Set edge forms or bulkheads and intermediate screed strips for slabs to obtain indicated elevations and contours in finished slab surface and must be strong enough to support vibrating bridge screeds or roller pipe screeds if nature of specified slab finish requires use of such equipment.

b. Align concrete surface to elevation of screed strips by use of

strike-off templates or approved compacting-type screeds.

3.2.5 Reinforcement and Other Embedded Items

a. Secure reinforcement, joint materials, and other embedded materials in position, inspected, and approved before start of concrete placing.

b. When concrete is placed, reinforcement must be free of materials deleterious to bond. Reinforcement with rust, mill scale, or a combination of both will be considered satisfactory, provided minimum nominal dimensions, nominal weight, and minimum average height of deformations of a hand-wire-brushed test specimen are not less than applicable ASTM specification requirements.

3.3 FORMS

a. Provide forms, shoring, and scaffolding for concrete placement. Set forms mortar-tight and true to line and grade.

b. Chamfer above grade exposed joints, edges, and external corners of concrete 0.75 inch. Place chamfer strips in corners of formwork to produce beveled edges on permanently exposed surfaces.

c. Provide formwork with clean-out openings to permit inspection and removal of debris.

d. Inspect formwork and remove foreign material before concrete is placed.

e. At construction joints, lap form-facing materials over the concrete of previous placement. Ensure formwork is placed against hardened concrete so offsets at construction joints conform to specified tolerances.

f. Provide positive means of adjustment such as wedges or jacks of shores and struts. Do not make adjustments in formwork after concrete has reached initial setting. Brace formwork to resist lateral deflection and lateral instability.

g. Fasten form wedges in place after final adjustment of forms and before concrete placement.

h. Provide anchoring and bracing to control upward and lateral movement of formwork system.

i. Construct formwork for openings to facilitate removal and to produce opening dimensions as specified and within tolerances.

j. Provide runways for moving equipment. Support runways directly on formwork or structural members. Do not support runways on reinforcement. Loading applied by runways must not exceed capacity of formwork or structural members.

k. Position and support expansion joint materials, waterstops, and other embedded items to prevent displacement. Fill voids in sleeves, inserts, and anchor slots temporarily with removable material to prevent concrete entry into voids.

l. Clean surfaces of formwork and embedded materials of mortar, grout, and foreign materials before concrete placement.

3.3.1 Coating

a. Cover formwork surfaces with an acceptable material that inhibits bond with concrete.

b. If formwork release agent is used, apply to formwork surfaces in accordance with manufacturer's recommendations before placing reinforcement. Remove excess release agent on formwork prior to concrete placement.

c. Do not allow formwork release agent to contact reinforcement or hardened concrete against which fresh concrete is to be placed.

3.3.2 Reuse

a. Reuse forms providing the structural integrity of concrete and the aesthetics of exposed concrete are not compromised.

b. Wood forms must not be clogged with paste and must be capable of absorbing high water-cementitious material ratio paste.

c. Remove leaked mortar from formwork joints before reuse.

3.3.3 Forms for Standard Rough Form Finish

Provide formwork in accordance with ACI 301 Section 5 with a surface finish, SF-1.0, for formed surfaces that are to be concealed by other construction.

3.3.4 Forms for Standard Smooth Form Finish

Provide formwork in accordance with ACI 301 Section 5 with a surface finish, SF-3.0, for formed surfaces that are exposed to view.

3.3.5 Form Ties

a. After ends or end fasteners of form ties have been removed, repair tie holes in accordance with ACI 301 Section 5 requirements.

3.3.6 Tolerances for Form Construction

a. Construct formwork so concrete surfaces conform to tolerances in ACI 117.

b. Position and secure sleeves, inserts, anchors, and other embedded items such that embedded items are positioned within ACI 117 tolerances.

c. To maintain specified elevation and thickness within tolerances, install formwork to compensate for deflection and anticipated settlement in formwork during concrete placement. Set formwork and intermediate screed strips for slabs to produce designated elevation, camber, and contour of finished surface before formwork removal. If specified finish requires use of vibrating screeds or roller pipe screeds, ensure that edge forms and screed strips are strong enough to support such equipment.

3.3.7 Removal of Forms and Supports

a. If vertical formed surfaces require finishing, remove forms as soon as removal operations will not damage concrete.

b. Remove top forms on sloping surfaces of concrete as soon as removal will not allow concrete to sag. Perform repairs and finishing operations required. If forms are removed before end of specified curing period, provide curing and protection.

c. Do not damage concrete during removal of vertical formwork for columns, walls, and sides of beams. Perform needed repair and finishing operations required on vertical surfaces. If forms are removed before end of specified curing period, provide curing and protection.

d. Leave formwork and shoring in place to support construction loads and other structural members until in-place required strength of concrete is reached.

e. Form-facing material and horizontal facing support members may be removed before in-place concrete reaches specified compressive strength if shores and other supports are designed to allow facing removal without deflection of supported slab or member.

3.3.8 Strength of Concrete Required for Removal of Formwork

If removal of formwork is based on concrete reaching a specified in-place strength, mold and field-cure cylinders in accordance with ASTM C31/C31M. Test cylinders in accordance with ASTM C39/C39M. Alternatively, use one or more of the methods listed herein to evaluate in-place concrete strength for formwork removal.

a. Tests of cast-in-place cylinders in accordance with ASTM C873/C873M. This option is limited to slabs with concrete depths from 5 to 12 in.

b. Penetration resistance in accordance with ASTM C803/C803M.

c. Pullout strength in accordance with ASTM C900.

d. Maturity method in accordance with ASTM C1074. Submit maturity method data using project materials and concrete mix proportions used on the project to demonstrate the correlation between maturity and compressive strength of laboratory cured test specimens to the Contracting Officer.

3.4 PLACING REINFORCEMENT AND MISCELLANEOUS MATERIALS

a. Unless otherwise specified, placing reinforcement and miscellaneous materials must be in accordance to ACI 301. Provide bars, welded wire reinforcement, wire ties, supports, and other devices necessary to install and secure reinforcement. See Paragraph 2.6.5 Reinforcing Bar Supports.

b. Reinforcement must not have rust, scale, oil, grease, clay, or foreign substances that would reduce the bond. Rusting of reinforcement is a basis of rejection if the effective cross-sectional area or the nominal weight per unit length has been reduced. Remove loose rust

prior to placing steel. Tack welding is prohibited.

c. Nonprestressed cast-in-place concrete members must have concrete cover for reinforcement given in the following table:

| **Concrete Exposure** | **Member** | **Reinforcement** | **Specified cover, in.** |
|---|---|---|---|
| Cast against and permanently in contact with ground | All | All | 3 |
| Exposed to weather or in contact with ground | All | No. 6 through No. 18 bars | 2 |
| | | No. 5 bar, W31 or D31 wire, and smaller | 1-1/2 |
| Not exposed to weather or in contact with ground | Slabs, joists, and walls | No. 14 and No. 18 bars | 1-1/2 |
| | | No. 11 bar and smaller | 3/4 |
| | Beams, columns, pedestals, and tension ties | Primary reinforcement, stirrups, ties, spirals, and hoops | 1-1/2 |

3.4.1 General

Provide details of reinforcement that are in accordance with the Contract Documents.

3.4.2 Vapor Retarder

a. Install in accordance with ASTM E1643. Provide beneath the on-grade concrete floor slab. Use the greatest widths and lengths practicable to eliminate joints wherever possible. Lap joints a minimum of 12 inches and tape.

b. Remove torn, punctured, or damaged vapor retarder material and provide with new vapor retarder prior to placing concrete. Concrete placement must not damage vapor retarder material.

3.4.3 Perimeter Insulation

Install perimeter insulation at locations indicated. Adhesive must be used where insulation is applied to the interior surface of foundation walls and may be used for exterior application.

3.4.4 Reinforcement Supports

Provide reinforcement support in accordance with CRSI RB4.1 and ACI 301 Section 3 requirements. Supports for coated or galvanized bars must also be coated with electrically compatible material for a distance of at least 2 inches beyond the point of contact with the bars.

3.4.5 Splicing

As indicated in the Contract Documents. For splices not indicated follow ACI 301. Do not splice at points of maximum stress. Overlap welded wire reinforcement the spacing of the cross wires, plus 2 inches. Welded splices shall be in accordance with AWS D1.4/D1.4M. Approve welded splices prior to use.

3.4.6 Future Bonding

Plug exposed, threaded, mechanical reinforcement bar connectors with a greased bolt. Provide bolt threads that match the connector. Countersink the connector in the concrete. Caulk the depression after the bolt is installed.

3.4.7 Setting Miscellaneous Material

Place and secure anchors and bolts, pipe sleeves, conduits, and other such items in position before concrete placement and support against displacement. Plumb anchor bolts and check location and elevation. Temporarily fill voids in sleeves with readily removable material to prevent the entry of concrete.

3.4.8 Fabrication

Shop fabricate reinforcing bars to conform to shapes and dimensions indicated for reinforcement, and as follows:

a. Provide fabrication tolerances that are in accordance with ACI 117.

b. Provide hooks and bends that are in accordance with the Contract Documents.

Reinforcement must be bent cold to shapes as indicated. Bending must be done in the shop. Rebending of a reinforcing bar that has been bent incorrectly is not be permitted. Bending must be in accordance with standard approved practice and by approved machine methods.

Deliver reinforcing bars bundled, tagged, and marked. Tags must be metal with bar size, length, mark, and other information pressed in by machine. Marks must correspond with those used on the placing drawings.

Do not use reinforcement that has any of the following defects:

a. Bar lengths, depths, and bends beyond specified fabrication tolerances

b. Bends or kinks not indicated on drawings or approved shop drawings

c. Bars with reduced cross-section due to rusting or other cause

Replace defective reinforcement with new reinforcement having required shape, form, and cross-section area.

3.4.9 Placing Reinforcement

Place reinforcement in accordance with ACI 301.

For slabs on grade (over earth or over capillary water barrier), slabs placed over void forms, and for footing reinforcement, support bars or welded wire reinforcement on precast concrete blocks, plastic coated steel fabricated with bearing plates, or specifically designed wire-fabric supports fabricated of plastic, spaced at intervals required by size of reinforcement, to keep reinforcement the minimum height specified above the underside of slab or footing.

Provide reinforcement that is supported and secured together to prevent displacement by construction loads or by placing of wet concrete, and as follows:

a. Provide supports for reinforcing bars that are sufficient in number and have sufficient strength to carry the reinforcement they support, and in accordance with ACI 301 and CRSI 10MSP. Do not use supports to support runways for concrete conveying equipment and similar construction loads.

b. Equip supports on ground and similar surfaces with sand-plates.

c. Support welded wire reinforcement as required for reinforcing bars.

d. Secure reinforcement to supports by means of tie wire. Wire must be black, soft iron wire, not less than 16 gage.

e. Reinforcement must be accurately placed, securely tied at intersections, and held in position during placing of concrete by spacers, chairs, or other approved supports. Point wire-tie ends away from the form.

f. Bending of reinforcing bars partially embedded in concrete is not permitted.

3.4.10 Spacing of Reinforcing Bars

a. Spacing must be as indicated in the Contract Documents.

b. Reinforcing bars may be relocated to avoid interference with other reinforcement, or with conduit, pipe, or other embedded items. If any reinforcing bar is moved a distance exceeding one bar diameter or specified placing tolerance, resulting rearrangement of reinforcement is subject to preapproval by the Contracting Officer.

3.4.11 Concrete Protection for Reinforcement

Additional concrete protection must be in accordance with the Contract Documents.

### 3.4.12 Welding

Welding must be in accordance with AWS D1.4/D1.4M.

## 3.5 BATCHING, MEASURING, MIXING, AND TRANSPORTING CONCRETE

In accordance with ASTM C94/C94M, ACI 301, ACI 302.1R and ACI 304R, except as modified herein. Batching equipment must be such that the concrete ingredients are consistently measured within the following tolerances: 1 percent for cement and water, 2 percent for aggregate, and 3 percent for admixtures. Furnish mandatory batch ticket information for each load of ready mix concrete.

### 3.5.1 Measuring

Make measurements at intervals as specified in paragraphs SAMPLING and TESTING.

### 3.5.2 Mixing

a. Mix concrete in accordance with ASTM C94/C94M, ACI 301 and ACI 304R.

b. Machine mix concrete. Begin mixing within 30 minutes after the cement has been added to the aggregates. Place concrete within 90 minutes of either addition of mixing water to cement and aggregates or addition of cement to aggregates if the air temperature is less than 84 degrees F.

c. Reduce mixing time and place concrete within 60 minutes if the air temperature is greater than 84 degrees F except as follows: if set retarding admixture is used and slump requirements can be met, limit for placing concrete may remain at 90 minutes. Additional water may be added, provided that both the specified maximum slump and submitted water-cementitious material ratio are not exceeded and the required concrete strength is still met. When additional water is added, an additional 30 revolutions of the mixer at mixing speed is required.

d. If the entrained air content falls below the specified limit, add a sufficient quantity of admixture to bring the entrained air content within the specified limits. Dissolve admixtures in the mixing water and mix in the drum to uniformly distribute the admixture throughout the batch. Do not reconstitute concrete that has begun to solidify.

### 3.5.3 Transporting

Transport concrete from the mixer to the forms as rapidly as practicable. Prevent segregation or loss of ingredients. Clean transporting equipment thoroughly before each batch. Do not use aluminum pipe or chutes. Remove concrete which has segregated in transporting and dispose of as directed.

## 3.6 PLACING CONCRETE

Place concrete in accordance with ACI 301 Section 5.

### 3.6.1 Pumping

ACI 304R and ACI 304.2R. Pumping must not result in separation or loss of materials nor cause interruptions sufficient to permit loss of plasticity between successive increments. Loss of slump in pumping equipment must not exceed 2 inches at discharge/placement. Do not convey concrete through pipe made of aluminum or aluminum alloy. Avoid rapid changes in pipe sizes. Limit maximum size of course aggregate to 33 percent of the diameter of the pipe. Limit maximum size of well-rounded aggregate to 40 percent of the pipe diameter. Take samples for testing at both the point of delivery to the pump and at the discharge end.

### 3.6.2 Cold Weather

Cold weather concrete must meet the requirements of ACI 301 unless otherwise specified. Do not allow concrete temperature to decrease below 50 degrees F. Obtain approval prior to placing concrete when the ambient temperature is below 40 degrees F or when concrete is likely to be subjected to freezing temperatures within 24 hours. Cover concrete and provide sufficient heat to maintain 50 degrees F minimum adjacent to both the formwork and the structure while curing. Limit the rate of cooling to 37 degrees F in any 1 hour and 50 degrees F per 24 hours after heat application.

### 3.6.3 Hot Weather

Hot weather concrete must meet the requirements of ACI 301unless otherwise specified. Maintain required concrete temperature using Figure 4.2 in ACI 305R to prevent the evaporation rate from exceeding 0.2 pound of water per square foot of exposed concrete per hour. Cool ingredients before mixing or use other suitable means to control concrete temperature and prevent rapid drying of newly placed concrete. Shade the fresh concrete as soon as possible after placing. Start curing when the surface of the fresh concrete is sufficiently hard to permit curing without damage. Provide water hoses, pipes, spraying equipment, and water hauling equipment, where job site is remote to water source, to maintain a moist concrete surface throughout the curing period. Provide burlap cover or other suitable, permeable material with fog spray or continuous wetting of the concrete when weather conditions prevent the use of either liquid membrane curing compound or impervious sheets. For vertical surfaces, protect forms from direct sunlight and add water to top of structure once concrete is set.

### 3.6.4 Bonding

Surfaces of set concrete at joints, must be roughened and cleaned of laitance, coatings, loose particles, and foreign matter. Roughen surfaces in a manner that exposes the aggregate uniformly and does not leave laitance, loosened particles of aggregate, nor damaged concrete at the surface.

Obtain bonding of fresh concrete that has set as follows:

a. At joints between footings and walls or columns, between walls or columns and the beams or slabs they support, and elsewhere unless otherwise specified; roughened and cleaned surface of set concrete must be dampened, but not saturated, immediately prior to placing of fresh concrete.

b. At joints in exposed-to-view work; at vertical joints in walls; at joints near midpoint of span in girders, beams, supported slabs, other structural members; in work designed to contain liquids; the roughened and cleaned surface of set concrete must be dampened but not saturated and covered with a cement grout coating.

c. Provide cement grout that consists of equal parts of portland cement and fine aggregate by weight with not more than 6 gallons of water per sack of cement. Apply cement grout with a stiff broom or brush to a minimum thickness of 1/16 inch. Deposit fresh concrete before cement grout has attained its initial set.

## 3.7 WASTE MANAGEMENT

Provide as specified in the Waste Management Plan and as follows.

### 3.7.1 Mixing Equipment

Before concrete pours, designate Contractor-owned site meeting environmental standards

### 3.7.2 Hardened, Cured Waste Concrete

Crush and reuse hardened, cured waste concrete as fill or as a base course for pavement.

### 3.7.3 Reinforcing Steel

Collect reinforcing steel and place in designated area for recycling.

### 3.7.4 Other Waste

Identify concrete manufacturer's or supplier's policy for collection or return of construction waste, unused material, deconstruction waste, and/or packaging material.

## 3.8 SURFACE FINISHES EXCEPT FLOOR, SLAB, AND PAVEMENT FINISHES

### 3.8.1 Defects

Repair surface defects in accordance with ACI 301 Section 5.

### 3.8.2 Not Against Forms (Top of Walls)

Surfaces not otherwise specified must be finished with wood floats to even surfaces. Finish must match adjacent finishes.

### 3.8.3 Formed Surfaces

#### 3.8.3.1 Tolerances

Tolerances in accordance with ACI 117 and as indicated.

#### 3.8.3.2 As-Cast Rough Form

Provide for surfaces not exposed to public view a surface finish SF-1.0. Patch holes and defects in accordance with ACI 301.

3.8.3.3 Standard Smooth Finish

Provide for surfaces exposed to public view a surface finish SF-3.0. Patch holes and defects in accordance with ACI 301.

3.9 FLOOR, SLAB, AND PAVEMENT FINISHES AND MISCELLANEOUS CONSTRUCTION

In accordance with ACI 301 and ACI 302.1R, unless otherwise specified. Slope floors uniformly to drains where drains are provided.

3.9.1 Finish

Place, consolidate, and immediately strike off concrete to obtain proper contour, grade, and elevation before bleedwater appears. Permit concrete to attain a set sufficient for floating and supporting the weight of the finisher and equipment. If bleedwater is present prior to floating the surface, drag the excess water off or remove by absorption with porous materials. Do not use dry cement to absorb bleedwater.

3.9.1.1 Scratched

Use for surfaces intended to receive bonded applied cementitious applications. Finish concrete in accordance with ACI 301 Section 5 for a scratched finish.

3.9.1.2 Floated

Use for exterior slabs where not otherwise specified. Finish concrete in accordance with ACI 301 Section 5 for a floated finish.

3.9.1.3 Steel Troweled

Use for floors intended as walking surfaces, and for reception of floor coverings. Finish concrete in accordance with ACI 301 Section 5 for a steel troweled finish.

3.9.1.4 Broomed

Use on surfaces of the Apparatus Bay and Work Room floor slabs. Direction of brooming shall be as indicated on the drawings. Provide three samples of varying degrees of roughness of broomed finish, per paragraph "slab surface sample". The Contracting Officer will indicate which of the three broom surface treatments is to be used on the Apparatus Bay and Work Room slab surfaces, based upon the appearance and effectiveness of producing a durable uniform non-slip surface. Finish concrete in accordance with ACI 301 Section 5 for a broomed finish. Finish edges and joints with an edger. Exterior walks and platforms shall be given a broomed finish, unless otherwise indicated.

3.9.1.5 Pavement

Screed the concrete with a template advanced with a combined longitudinal and crosswise motion. Maintain a slight surplus of concrete ahead of the template. After screeding, float the concrete longitudinally. Use a straightedge to check slope and flatness; correct and refloat as necessary. Obtain final finish by belting. Lay belt flat on the concrete surface and advance with a sawing motion; continue until a uniform but gritty nonslip surface is obtained. Round edges and joints with an edger having a radius of 1/8 inch.

3.9.1.6 Liquid Chemical Floor Sealer

Apply liquid-chemical floor sealer to the surface of the Apparatus Bay floor slab after curing and drying of the concrete. Apply floor sealer per the manufacturer's directions.

3.9.2 Flat Floor Finishes

ACI 302.1R. Construct in accordance with one of the methods recommended in Table 7.15.3, "Typical Composite Ff/FL Values for Various Construction Methods." ACI 117 for tolerance tested by ASTM E1155.

a. Floor aeas to receive thin-set grout tile:

| | |
|---|---|
| Floor Flatness (Ff) | 35 |
| Floor Levelness (FL) | 25 |

b. Floor areas to receive carpet or other coverings:

| | |
|---|---|
| Floor Flatness (Ff) | 25 |
| Floor Levelness (FL) | 20 |

c. Aparatus Bay and other floors:

| | |
|---|---|
| Floor Flatness (Ff) | 20 |
| Floor Levelness (FL) | 15 |

Note: Levelness does not apply to the sloped Apparatus Bay floor slab.

3.9.2.1 Measurement of Floor Tolerances

Test slab within 24 hours of the final troweling. Provide tests to Contracting Officer within 12 hours after collecting the data. Floor flatness inspector is required to provide a tolerance report which must include:

a. Key plan showing location of data collected.

b. Results required by ASTM E1155.

3.9.2.2 Remedies for Out of Tolerance Work

Contractor is required to repair and retest any floors not meeting specified tolerances. Prior to repair, Contractor must submit and receive approval for the proposed repair, including product data from any materials proposed. Repairs must not result in damage to structural integrity of the floor. For floors exposed to public view, repairs must prevent any uneven or unusual coloring of the surface.

3.9.3 Trench Drains

Place floor trench drains in the Apparatus Bay as indicated, and per the manufaturer's instructions, securing the frame at the indicated floor level, and using the manufacturer's form units to form the required depth, profile and slope of the drain basin. Provide reinforcement as indicated.

3.9.4 Splash Blocks

Provide at outlets of downspouts emptying at grade. Splash blocks may be precast concrete, and must be 24 inches long, 12 inches wide and 4 inches thick, unless otherwise indicated, with smooth-finished countersunk dishes sloped to drain away from the building.

3.10 JOINTS

3.10.1 Construction Joints

Make and locate joints not indicated so as not to impair strength and appearance of the structure, as approved. Joints must be perpendicular to main reinforcement. Reinforcement must be continued and developed across construction joints. Locate construction joints as follows:

3.10.1.1 Maximum Allowable Construction Joint Spacing

a. In walls at not more than 60 feet in any horizontal direction.

b. In slabs on ground, so as to divide slab into areas not in excess of 1,200 square feet.

3.10.1.2 Construction Joints for Constructability Purposes

Except as otherwise indicated:

a. In walls, at top of footing; at top of slabs on ground; at top and bottom of door and window openings or where required to conform to architectural details; and at underside of deepest beam or girder framing into wall.

b. In columns or piers, at top of footing; at top of slabs on ground; and at underside of deepest beam or girder framing into column or pier.

c. Near midpoint of spans for supported slabs, beams, and girders unless a beam intersects a girder at the center, in which case construction joints in girder must offset a distance equal to twice the width of the beam. Make transfer of shear through construction joint by use of inclined reinforcement.

Provide keyways at least 1-1/2-inches deep in construction joints in walls and elevated slabs.

3.10.2 Isolation Joints in Slabs on Ground

a. Provide joints at points of contact between slabs on ground and vertical surfaces, such as column pedestals, foundation walls, grade beams, and elsewhere as indicated.

b. Fill joints with premolded joint filler strips 1/2 inch thick, extending full slab depth. Install filler strips at proper level below finish floor elevation with a slightly tapered, dress-and-oiled wood strip temporarily secured to top of filler strip to form a groove not less than 3/4 inch in depth where joint is sealed with sealing compound and not less than 1/4 inch in depth where joint sealing is not required. Remove wood strip after concrete has set. Contractor must clean groove of foreign matter and loose particles after surface has dried.

3.10.3 Contraction Joints in Slabs on Ground

a. Provide joints to form panels as indicated.

b. Under and on exact line of each control joint, cut 50 percent of reinforcement before placing concrete.

c. Sawcut contraction joints into slab on ground in accordance with ACI 301 Section 5.

d. Joints must be 1/8-inch wide by 1/5 to 1/4 of slab depth and formed by inserting hand-pressed fiberboard strip into fresh concrete until top surface of strip is flush with slab surface. After concrete has cured for at least 7 days, the Contractor must remove inserts and clean groove of foreign matter and loose particles.

e. Sawcutting will be limited to within 12 hours after set and at 1/4 slab depth.

3.10.4 Sealing Joints in Slabs on Ground

a. Contraction and control joints which are to receive finish flooring material must be sealed with joint sealing compound after concrete curing period. Slightly underfill groove with joint sealing compound to prevent extrusion of compound. Remove excess material as soon after sealing as possible.

b. Sealed groove must be left ready to receive filling material that is provided as part of finish floor covering work.

3.11 CURING AND PROTECTION

Curing and protection in accordance with ACI 301 Section 5, unless otherwise specified. Begin curing immediately following form removal. Avoid damage to concrete from vibration created by movement of equipment in the vicinity, disturbance of formwork or protruding reinforcement, and any other activity resulting in ground vibrations. Protect concrete from injurious action by sun, rain, flowing water, frost, mechanical injury, tire marks, and oil stains. Do not allow concrete to dry out from time of placement until the expiration of the specified curing period. Do not use membrane-forming compound on surfaces where appearance would be objectionable, on any surface to be painted, where coverings are to be bonded to the concrete, or on concrete to which other concrete is to be bonded. If forms are removed prior to the expiration of the curing period, provide another curing procedure specified herein for the remaining portion of the curing period. Provide moist curing for those areas receiving liquid chemical sealer. Allow curing compound/sealer installations to cure prior to the installation of materials that adsorb VOCs.

3.11.1 Requirements for Type III, High-Early-Strength Portland Cement

The curing periods are required to be not less than one-fourth of those specified for portland cement, but in no case less than 72 hours.

3.11.2 Curing Periods

ACI 301 Section 5, except 10 days for retaining walls, pavement or

chimneys. Begin curing immediately after placement. Protect concrete from premature drying, excessively hot temperatures, and mechanical injury; and maintain minimal moisture loss at a relatively constant temperature for the period necessary for hydration of the cement and hardening of the concrete. The materials and methods of curing are subject to approval by the Contracting Officer.

3.11.3 Curing Formed Surfaces

Accomplish curing of formed surfaces, including undersurfaces of supported slabs, and other similar surfaces by moist curing with forms in place for full curing period or until forms are removed. If forms are removed before end of curing period, accomplish final curing of formed surfaces by any of the curing methods specified above, as applicable.

3.11.4 Curing Unformed Surfaces

a. Accomplish initial curing of unformed surfaces, such as monolithic slabs and other flat surfaces, by membrane curing.

b. Accomplish final curing of unformed surfaces by any of curing methods specified, as applicable.

c. Accomplish final curing of concrete surfaces to receive liquid floor sealer or finish flooring by moisture-retaining cover curing.

3.11.5 Temperature of Concrete During Curing

When temperature of atmosphere is 41 degrees F and below, maintain temperature of concrete at not less than 55 degrees F throughout concrete curing period or 45 degrees F when the curing period is measured by maturity. When necessary, make arrangements before start of concrete placing for heating, covering, insulation, or housing as required to maintain specified temperature and moisture conditions for concrete during curing period.

When the temperature of atmosphere is 80 degrees F and above or during other climatic conditions which cause too rapid drying of concrete, make arrangements before start of concrete placing for installation of wind breaks, of shading, and for fog spraying, wet sprinkling, or moisture-retaining covering of light color as required to protect concrete during curing period.

Changes in temperature of concrete must be uniform and not exceed 37 degrees F in any 1 hour nor 80 degrees F in any 24-hour period.

3.11.6 Protection from Mechanical Injury

During curing period, protect concrete from damaging mechanical disturbances, particularly load stresses, heavy shock, and excessive vibration and from damage caused by rain or running water.

3.11.7 Protection After Curing

Protect finished concrete surfaces from damage by construction operations.

## 3.12 FIELD QUALITY CONTROL

### 3.12.1 Sampling

ASTM C172/C172M. Collect samples of fresh concrete to perform tests specified. ASTM C31/C31M for making test specimens.

### 3.12.2 Testing

#### 3.12.2.1 Slump Tests

ASTM C143/C143M. Take concrete samples during concrete placement/discharge. The maximum slump may be increased as specified with the addition of an approved admixture provided that the water-cementitious material ratio is not exceeded. Perform tests at commencement of concrete placement, when test cylinders are made, and for each batch (minimum) or every 20 cubic yards (maximum) of concrete.

#### 3.12.2.2 Temperature Tests

Test the concrete delivered and the concrete in the forms. Perform tests in hot or cold weather conditions (below 50 degrees F and above 80 degrees F) for each batch (minimum) or every 20 cubic yards (maximum) of concrete, until the specified temperature is obtained, and whenever test cylinders and slump tests are made.

#### 3.12.2.3 Compressive Strength Tests

ASTM C39/C39M. Make six 6 inch by 12 inch test cylinders for each set of tests in accordance with ASTM C31/C31M, ASTM C172/C172M and applicable requirements of ACI 305R and ACI 306R. Take precautions to prevent evaporation and loss of water from the specimen. Test two cylinders at 7 days, two cylinders at 28 days, and hold two cylinder in reserve. Take samples for strength tests of each mix design of concrete placed each day, not less than once a day, nor less than once for each 100 cubic yards of concrete for the first 500 cubic yards, then every 500 cubic yards thereafter, nor less than once for each 5400 square feet of surface area for slabs or walls. For the entire project, take no less than five sets of samples and perform strength tests for each mix design of concrete placed. Each strength test result must be the average of two cylinders from the same concrete sample tested at 28 days. Concrete compressive tests must meet the requirements of this section, the Contract Document, and ACI 301. Retest locations represented by erratic core strengths. Where retest does not meet concrete compressive strength requirements submit a mitigation or remediation plan for review and approval by the contracting officer. Repair core holes with nonshrink grout. Match color and finish of adjacent concrete.

#### 3.12.2.4 Air Content

ASTM C173/C173M or ASTM C231/C231M for normal weight concrete. Test air-entrained concrete for air content at the same frequency as specified for slump tests.

#### 3.12.2.5 Unit Weight of Structural Concrete

ASTM C138/C138M. Determine unit weight of normal weight concrete. Perform test for every 20 cubic yards maximum.

3.12.2.6 Chloride Ion Concentration

Chloride ion concentration must meet the requirements of the paragraph titled CORROSION AND CHLORIDE CONTENT. Determine water soluble ion concentration in accordance with ASTM C1218/C1218M. Perform test once for each mix design.

3.12.2.7 Strength of Concrete Structure

The strength of the concrete structure will be considered to be deficient if any of the following conditions are identified:

a. Failure to meet compressive strength tests as evaluated.

b. Reinforcement not conforming to requirements specified.

c. Concrete which differs from required dimensions or location in such a manner as to reduce strength.

d. Concrete curing and protection of concrete against extremes of temperature during curing, not conforming to requirements specified.

e. Concrete subjected to damaging mechanical disturbances, particularly load stresses, heavy shock, and excessive vibration.

f. Poor workmanship likely to result in deficient strength.

Where the strength of the concrete structure is considered deficient submit a mitigation or remediation plan for review and approval by the contracting officer.

3.12.2.8 Non-Conforming Materials

Factors that indicate that there are non-conforming materials include (but not limited to) excessive compressive strength, inadequate compressive strength, excessive slump, excessive voids and honeycombing, concrete delivery records that indicate excessive time between mixing and placement, or excessive water was added to the mixture during delivery and placement. Any of these indicators alone are sufficient reason for the Contracting Officer to request additional sampling and testing.

Investigations into non-conforming materials must be conducted at the Contractor's expense. The Contractor must be responsible for the investigation and must make written recommendations to adequately mitigate or remediate the non-conforming material. The Contracting Officer may accept, accept with reduced payment, require mitigation, or require removal and replacement of non-conforming material at no additional cost to the Government.

3.12.2.9 Testing Concrete Structure for Strength

When there is evidence that strength of concrete structure in place does not meet specification requirements or there are non-conforming materials, make cores drilled from hardened concrete for compressive strength determination in accordance with ASTM C42/C42M, and as follows:

a. Take at least three representative cores from each member or area of concrete-in-place that is considered potentially deficient. Location of cores will be determined by the Contracting Officer.

b. Test cores after moisture conditioning in accordance with ASTM C42/C42M if concrete they represent is more than superficially wet under service.

c. Air dry cores, (60 to 80 degrees F with relative humidity less than 60 percent) for 7 days before test and test dry if concrete they represent is dry under service conditions.

d. Strength of cores from each member or area are considered satisfactory if their average is equal to or greater than 85 percent of the 28-day design compressive strength of the class of concrete.

Fill core holes solid with patching mortar and finished to match adjacent concrete surfaces.

Correct concrete work that is found inadequate by core tests in a manner approved by the Contracting Officer.

## 3.13 REPAIR, REHABILITATION AND REMOVAL

Before the Contracting Officer accepts the structures the Contractor must inspect the structure for cracks, damage and substandard concrete placements that may adversely affect the service life of either structure. A report documenting these defects must be prepared which includes recommendations for repair, removal or remediation must be submitted to the Contracting Officer for approval before any corrective work is accomplished.

### 3.13.1 Repair of Weak Surfaces

Weak surfaces are defined as mortar-rich, rain-damaged, uncured, or containing exposed voids or deleterious materials. Concrete surfaces with weak surfaces less than 1/4 inch thick must be diamond ground to remove the weak surface. Surfaces containing weak surfaces greater than 1/4 inch thick must be removed and replaced or mitigated in a manner acceptable to the Contracting Officer.

### 3.13.2 Failure of Quality Assurance Test Results

Proposed mitigation efforts by the Contractor must be approved by the Contracting Officer prior to proceeding.

1.2 SUBMITTALS

All submittals are the responsibility of the precast concrete producer. Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Quality Control Procedures

SD-02 Shop Drawings

Standard Precast Units; G, RO
Custom-Made Precast Units; G, RO
Special Finishes

SD-03 Product Data

Standard Precast Units
Proprietary Precast Units
Embedded Items
Accessories

SD-05 Design Data

Design Calculations; G, RO
Concrete Mix Proportions

SD-06 Test Reports

Test Reports

SD-07 Certificates

Quality Control Procedures

SD-11 Closeout Submittals

Recycled content for fly ash and pozzolan; S
Recycled content for Ground Iron Blast-Furnace Slag; S
Recycled content for Silica Fume; S
Recycled content for Synthetic Fiber Reinforcement; S
Recycled content for steel; S

1.3 QUALITY ASSURANCE

Demonstrate adherence to the standards set forth in NPCA QC Manual or ACPA QPC. Meet requirements written in the subparagraphs below.

1.3.1 NPCA and ACPA Plant Certification

The precast concrete producer must be certified by the National Precast

Concrete Association's or the American Concrete Pipe Association's Plant Certification Program prior to and during production of the products for this project.

1.3.2 Qualifications, Quality Control and Inspection

1.3.2.1 Qualifications

Select a precast concrete producer that has been in the business of producing precast concrete units similar to those specified for a minimum of 3 years. The precast concrete producer must maintain a permanent quality control department or retain an independent testing agency on a continuing basis.

1.3.2.2 Quality Control Procedures

Submit quality control procedures established by the precast manufacturer in accordance with NPCA QC Manual and ACPA QPC. Show that the following QC tests are performed as required and in accordance with the ASTM standards indicated.

1.3.2.2.1 Slump

Perform a slump test for each 150 cu yd of concrete produced, or once a day, whichever comes first. Perform slump tests in accordance with ASTM C143/C143M.

1.3.2.2.2 Temperature

Measure the temperature of fresh concrete when slump or air content tests are made and when compressive test specimens are made in accordance with ASTM C1064/C1064M.

1.3.2.2.3 Compressive Strength

Make at least four compressive strength specimens for each 150 cubic yards of concrete of each mix in accordance with the following Standards: ASTM C31/C31M, ASTM C192/C192M, ASTM C39/C39M.

1.3.2.2.4 Air Content

Perform tests for air content on air-entrained, wet-cast concrete for each 150 cu yd of concrete, but not less often than once each day when air-entrained concrete is used. Determine the air content in accordance with either ASTM C231/C231M or ASTM C173/C173M for normal weight aggregates and ASTM C173/C173M for lightweight aggregates.

1.3.2.2.5 Unit Weight

Perform tests for unit weight a minimum of once per week to verify the yield of batch mixes. Perform unit weight tests for each 100 cu yd of lightweight concrete in accordance with ASTM C138/C138M.

1.3.2.3 Inspection

The Contracting Officer may place an inspector in the plant when the units covered by this specification are being manufactured. The burden of payment for plant inspection will be clearly detailed in the specification. The precast concrete producer must give notice 14 days

prior to the time the units will be available for plant inspection. Neither the exercise nor waiver of inspection at the plant will affect the Government's right to enforce contractual provisions after units are transported or erected.

1.3.2.4 Test Reports

Submit the following:

1.3.2.4.1 Material Certifications or Laboratory Test Reports

Include mill tests and all other test data, for portland cement, blended cement, pozzolans, ground granulated blast furnace slag, silica fume, aggregate, admixtures, and curing compound proposed for use on this project.

1.3.2.4.2 Mix Test

Submit reports showing that the mix has been successfully tested to produce concrete with the properties specified and will be suitable for the job conditions. Such tests may include compressive strength, flexural strength, plastic or hardened air content, freeze thaw durability, abrasion and absorption. Clearly detail in the specifications special tests for precast concrete or cast-in items.

1.3.2.4.3 Self-Consolidating Concrete

Submit sufficient documentation, when the use of self-consolidating concrete (SCC) is proposed, showing a minimum of 30-days production track records demonstrating that SCC is appropriate for casting of the product.

1.3.2.4.4 In-Plant QA/QC Inspection Reports

Submit inspection reports upon the request of the Contracting Officer.

1.4 DELIVERY, STORAGE, AND HANDLING

1.4.1 Delivery

Deliver precast units to the site in accordance with the delivery schedule to avoid excessive build-up of units in storage at the site. Upon delivery to the jobsite, all precast concrete units will be inspected by the Contracting Officer for quality and final acceptance.

1.4.2 Storage

Store units off the ground or in a manner that minimizes potential damage.

1.4.3 Handling

Handle, transport, and store products in a manner to minimize damage. Lifting devices or holes must be consistent with industry standards. Perform lifting with methods or devices intended for this purpose as indicated on shop drawings.

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Furnish precast concrete units designed and fabricated by an experienced and acceptable precast concrete manufacturer who has been, for at least three years, regularly and continuously engaged in the manufacture of precast concrete work similar to that indicated on the drawings. Coordinate precast work with the work of other trades. Below grade structures must comply with ASTM C858.

#### 2.1.1 Standard Precast Units

Design standard precast concrete units to withstand indicated design load conditions in accordance with applicable industry design standards ACI 318, ASTM C857, ACPA 01-102, Chapter 7-Design for Sulfide Control. Design must also consider stresses induced during handling, shipping and installation as to avoid product cracking or other handling damage. Indicate design loads for precast concrete units on the shop drawings. Submit drawings for standard precast concrete units furnished by the precast concrete producer for approval by the Contracting Officer. These drawings must demonstrate that the applicable industry design standards have been met. Include installation and construction information on shop drawings. Include details of steel reinforcement size and placement as well as supporting design calculations, if appropriate. Produce precast concrete units in accordance with the approved drawings. Submit cut sheets, for standard precast concrete units, showing conformance to project drawings and requirements, and to applicable industry design standards listed in this specification.

#### 2.1.2 Custom-Made Precast Units

Submit design calculations for custom-made precast units, prepared and sealed by a registered professional engineer, for approval prior to fabrication. Include in the calculations the analysis of units for lifting stresses and the sizing of lifting devices. Submit drawings furnished by the precast concrete producer for approval by the Contracting Officer. Show on these drawings complete design, installation, and construction information in such detail as to enable the Contracting Officer to determine the adequacy of the proposed units for the intended purpose. Include details of steel reinforcement size and placement as well as supporting design calculations, if appropriate. Produce precast concrete units in accordance with the approved drawings.

#### 2.1.3 Proprietary Precast Units

Products manufactured under franchise arrangements must conform to all the requirements specified by the franchiser. Items not included in the franchise specification, but included in this specification, must conform to the requirements in this specification. Submit standard plans or informative literature, for proprietary precast concrete units. Make available supporting calculations and design details upon request. Provide sufficient information as to demonstrate that such products will perform the intended task.

#### 2.1.4 Joints and Sealants

Provide joints and sealants between adjacent units of the type and configuration indicated on shop drawings meeting specified design and

performance requirements.

2.1.5 Concrete Mix Design

2.1.5.1 Concrete Mix Proportions

Base selection of proportions for concrete on the methodology presented in ACI 211.1 for normal weight concrete and ACI 211.2 for lightweight concrete. Develop the concrete proportions using the same type and brand of cement, the same type and brand of pozzolan, the same type and gradation of aggregates, and the same type and brand of admixture that will be used in the manufacture of precast concrete units for the project. Do not use calcium chloride in precast concrete containing reinforcing steel or other embedded metal items. At a minimum of thirty days prior to precast concrete unit manufacturing, the precast concrete producer will submit a mix design and proportions for each strength and type of concrete that will be used. Furnish a complete list of materials, including quantity, type, brand and applicable data sheets for all mix design constituents as well as applicable reference specifications. The use of self-consolidating concrete is permitted, provided that mix design proportions and constituents meet the requirements of this specification.

2.1.5.2 Concrete Strength

Provide precast concrete units with a 28-day compressive strength (f'c) of 4000_____ psi.

2.1.5.3 Water-to-Cement Ratio

Where exposed to freezing and thawing, furnish concrete containing entrained air and with a water-cementitious ratio of 0.45 or less. Where not exposed to freezing, but required to have a low permeability, furnish concrete with a water-cementitious ratio of 0.48 or less. Where exposed to deicer salts, brackish water, or seawater, furnish concrete with a water-cementitious ratio of 0.40 or less, for corrosion protection.

2.1.5.4 Air Content

The air content of concrete that will be exposed to freezing conditions must be within the limits given below.

| | AIR CONTENT PERCENT | |
|---|---|---|
| NOMINAL MAXIMUM AGGREGATE SIZE | EXPOSURE CLASS F1 | EXPOSURE CLASSES F2 and F3 |
| 3/8 inch | 6.0 | 7.5 |
| 1/2 inch | 5.5 | 7.0 |
| 3/4 inch | 5.0 | 6.0 |
| 1.0 inch | 4.5 | 6.0 |
| 1.5 inch | 4.5 | 5.5 |

| | AIR CONTENT PERCENT | |
|---|---|---|
| NOMINAL MAXIMUM AGGREGATE SIZE | EXPOSURE CLASS F1 | EXPOSURE CLASSES F2 and F3 |
| Note: For specified compressive strengths greater than 5000 psi, air content may be reduced 1 percent | | |

2.1.5.5 Corrosion Control for Sanitary Sewer Systems

Follow design recommendations outlined in Chapter 7 of ACPA 01-102 or the ACPA 01-110 when hydrogen sulfide is indicated as a potential problem.

2.2 MATERIALS

Except as otherwise specified in the following paragraphs, conform material to Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.2.1 Material Sustainability Criteria

For products in this section, where applicable and to extent allowed by performance criteria, provide and document the following in accordance with Section 01 33 29 SUSTAINABILITY REQUIREMENTS:

a. Recycled content for fly ash and pozzolan
b. Recycled content for Ground Iron Blast-Furnace Slag
c. Recycled content for Silica Fume
d. Recycled content for Synthetic Fiber Reinforcement
e. Recycled content for steel, 75 percent minimum

2.2.2 Pigments

Non-fading and lime-resistant

2.2.3 Reinforcement

2.2.3.1 Reinforcing Bars

a. Deformed Billet-steel: ASTM A615/A615M

b. Deformed Low-alloy steel: ASTM A706/A706M

2.2.3.2 Reinforcing Wire

a. Plain Wire: ASTM A1064/A1064M

b. Deformed Wire: ASTM A1064/A1064M

2.2.3.3 Welded Wire Reinforcement

a. Plain Wire: ASTM A1064/A1064M

b. Deformed Wire: ASTM A1064/A1064M

2.2.3.4 Epoxy Coated Reinforcement

a. Reinforcing Bars: ASTM A775/A775M

b. Wires and Welded Wire: ASTM A884/A884M

2.2.3.5 Galvanized Reinforcement

Provide galvanized reinforcement conforming to ASTM A767/A767M.

2.2.4 Inserts and Embedded Metal

All items embedded in concrete must be of the type required for the intended task, and meet the following standards.

a. Structural Steel Plates, Angles, etc.: ASTM A36/A36M

b. Hot-dipped Galvanized: ASTM A153/A153M

c. Proprietary Items: In accordance with manufacturers published literature

2.2.5 Accessories

Submit proper installation instructions and relevant product data for items including, but not limited to, sealants, gaskets, connectors, steps, cable racks and other items installed before or after delivery.

a. Rubber Gaskets for Circular Concrete Sewer Pipe and Culvert Pipe: ASTM C443.

b. External Sealing Bands for Noncircular Sewer, Storm Drain and Culvert Pipe: ASTM C877.

c. Preformed Flexible Joint Sealants for Concrete Pipe, Manholes, and Manufactured Box Sections: ASTM C990.

d. Elastomeric Joint Sealants: ASTM C920

2.2.6 Pipe Entry Connectors

Pipe entry connectors must conform to ASTM C923 or ASTM C1478.

2.2.7 Grout

Nonshrink Grout must conform to ASTM C1107/C1107M. Cementitious grout must be a mixture of portland cement, sand, and water. Proportion one part cement to approximately 2.5 parts sand, with the amount of water based on placement method. Provide air entrainment for grout exposed to the weather.

PART 3 EXECUTION

3.1 FABRICATION AND PLACEMENT

Perform fabrication in accordance with NPCA QC Manual or ACPA QPC unless specified otherwise.

3.1.1 Forms

Use forms, for manufacturing precast concrete products, of the type and design consistent with industry standards and practices. They should be

capable of consistently providing uniform products and dimensions. Construct forms so that the forces and vibrations to which the forms will be subjected can cause no product damage. Clean forms of concrete build-up after each use. Apply form release agents according to the manufacturers recommendations and do not allow to build up on the form casting surfaces.

3.1.2 Reinforcement

Follow applicable ASTM Standard or ACI 318 for placement and splicing. Fabricate cages of reinforcement either by tying the bars, wires or welded wire reinforcement into rigid assemblies or by welding, where permissible, in accordance with AWS D1.4/D1.4M. Position reinforcing as specified by the design and so that the concrete cover conforms to requirements. The tolerance on concrete cover must be one-third of that specified but not more than 1/2 inch. Provide concrete cover not less than 1/2 inch. Take positive means to assure that the reinforcement does not move significantly during the casting operations.

3.1.3 Embedded Items

Position embedded items at locations specified in the design documents. Perform welding in accordance with AWS D1.1/D1.1M when necessary. Hold rigidly in place inserts, plates, weldments, lifting devices and other items to be imbedded in precast concrete products so that they do not move significantly during casting operations. Submit product data sheets and proper installation instruction for anchors, lifting inserts and other devices. Clearly indicate the products dimensions and safe working load.

3.1.4 Synthetic Fiber Reinforced Concrete

Add fiber reinforcement to the concrete mix at the batch plant in accordance with the applicable sections of ASTM C1116/C1116M and the recommendations of the manufacturer. Use a minimum of 1.5 pounds of fibers per cubic yard of concrete.

3.2 CONCRETE

3.2.1 Concrete Mixing

Mixing operations must produce batch-to-batch uniformity of strength, consistency, and appearance.

3.2.2 Concrete Placing

Deposit concrete into forms as near to its final location as practical. Keep the free fall of the concrete to a minimum. Consolidate concrete in such a manner that segregation of the concrete is minimized and honeycombed areas are kept to a minimum. Use vibrators to consolidate concrete with frequencies and amplitudes sufficient to produce well consolidated concrete.

3.2.2.1 Cold Weather Concreting

Perform cold weather concreting in accordance with ACI 306.1.

a. Provide adequate equipment for heating concrete materials and protecting concrete during freezing or near-freezing weather.

b. All concrete materials, reinforcement, forms, fillers, and ground with which concrete is to come in contact must be free from frost.

c. Do not use frozen materials or materials containing ice.

d. In cold weather the temperature of concrete at the time of placing must not be below 45 degrees F. Discard concrete that freezes before its compressive strength reaches 500 psi.

3.2.2.2 Hot Weather Concreting

Follow recommendations for hot weather concreting in ACI 305R. During hot weather, give proper attention to constituents, production methods, handling, placing, protection, and curing to prevent excessive concrete temperatures or water evaporation that could impair required strength or serviceability of the member or structure. The temperature of concrete at the time of placing must not exceed 90 degrees F.

3.2.3 Concrete Curing

Commence curing immediately following the initial set and completion of surface finishing.

3.2.3.1 Curing by Moisture Retention

Prevent moisture evaporation from exposed surfaces until adequate strength for stripping is reached by one of the following methods:

a. Cover with polyethylene sheets a minimum of 6 mils thick in accordance with ASTM C171.

b. Cover with burlap or other absorptive material and keep continually moist.

c. Use a membrane-curing compound, conforming to ASTM C309 and applied at a rate not less than 200 square ft/gallon, or in accordance with manufacturers' recommendations.

3.2.3.2 Curing with Heat and Moisture

Do not subject concrete to steam or hot air until after the concrete has attained its initial set. Apply steam, if used, within a suitable enclosure, which permits free circulation of the steam in accordance with CSA A23.4. If hot air is used for curing, take precautions to prevent moisture loss from the concrete. The temperature of the concrete must not be permitted to exceed 150 degrees F. These requirements do not apply to products cured with steam under pressure in an autoclave.

3.2.4 Surface Finish

Finish unformed surfaces of wet-cast precast concrete products as specified. If no finishing procedure is specified, finish such surfaces using a strike-off to level the concrete with the top of the form.

3.2.4.1 Formed Non-Architectural Surfaces

Cast surfaces against approved forms following industry practices in cleaning forms, designing concrete mixes, placing and curing concrete. Normal color variations, form joint marks, small surface holes caused by

air bubbles, and minor chips and spalls will be accepted but no major imperfections, honeycombs or other major defects will be permitted.

3.2.4.2 Unformed Surfaces

Finish unformed surfaces with a vibrating screed, or by hand with a float. Normal color variations, minor indentations, minor chips and spalls will be accepted. Major imperfections, honeycombs, or other major defects are not permitted.

3.2.4.3 Special Finishes

Troweled, broom or other finishes must be according to the requirements of project documents and performed in accordance with industry standards or supplier specifications. Submit finishes for approval when required by the project documents. The sample finishes must be approved prior to the start of production.

3.2.5 Stripping Products from Forms

Do not remove products from the forms until the concrete reaches the compressive strength for stripping required by the design. If no such requirement exists, products may be removed from the forms after the final set of concrete provided that stripping damage is minimal.

3.2.6 Patching and Repair

No repair is required to formed surfaces that are relatively free of air voids and honeycombed areas, unless the surfaces are required by the design to be finished.

3.2.6.1 Repairing Minor Defects

Defects that will not impair the functional use or expected life of a precast concrete product may be repaired by any method that does not impair the product.

3.2.6.2 Repairing Honeycombed Areas

When honeycombed areas are to be repaired, remove all loose material and cut back the areas into essentially horizontal or vertical planes to a depth at which coarse aggregate particles break under chipping rather than being dislodged. Use proprietary repair materials in accordance with the manufacturer's instructions. If a proprietary repair material is not used, saturate the area with water. Immediately prior to repair, the area should be damp, but free of excess water. Apply a cement-sand grout or an approved bonding agent to the chipped surfaces, followed immediately by consolidating an appropriate repair material into the cavity.

3.2.6.3 Repairing Major Defects

Evaluate, by qualified personnel, defects in precast concrete products which impair the functional use or the expected life of products to determine if repairs are feasible and, if so, to establish the repair procedure.

3.2.7 Shipping Products

Do not ship products until they are at least five days old, unless it can

be shown that the concrete strength has reached at least 75 percent of the specified 28-day strength, or that damage will not result, impairing the performance of the product.

## 3.3 INSTALLATION

### 3.3.1 Site Access

It is the Contractor's responsibility to provide adequate access to the site to facilitate hauling, storage and proper handling of the precast concrete products.

### 3.3.2 General Requirements

a. Install precast concrete products to the lines and grades shown in the contract documents or otherwise specified.

b. Lift products by suitable lifting devices at points provided by the precast concrete producer.

c. Install products in accordance with the precast concrete producer's instructions. In the absence of such instructions, install underground utility structures in accordance with ASTM C891. Install pipe and manhole sections in accordance with the procedures outlined by the American Concrete Pipe Association.

d. Field modifications to the product will relieve the precast producer of liability even if such modifications result in the failure of the product.

### 3.3.3 Water Tightness

Where water tightness is a necessary performance characteristic of the precast concrete product's end use, watertight joints, connectors and inserts should be used to ensure the integrity of the entire system.

## 3.4 FIELD QUALITY CONTROL

### 3.4.1 Site Tests

When water tightness testing is required for an underground product, use one of the following methods:

### 3.4.2 Vacuum Testing

Prior to backfill vacuum test system according to ASTM C1244.

### 3.4.3 Water Testing

Perform water testing according to the contract documents and precast concrete producer's recommendations.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Reinforcement Detail Drawings; G, DO

SD-03 Product Data

Cement; G, DO

Cementitious Materials; G, DO

SD-05 Design Data

Masonry Compressive Strength; G, DO

Bracing Calculations; G, DO

SD-06 Test Reports

1.3 QUALITY ASSURANCE

Contractor shall include government representative at very beginning of masonry work for quality control purposes, to demonstrate typical masonry details and process. This does not preclude ongoing government oversight of masonry work through normal government inspection process.

1.4 DELIVERY, STORAGE, AND HANDLING

Deliver, store, handle, and protect material to avoid chipping, breakage, and contact with soil or contaminating material. Store and prepare materials in already disturbed areas to minimize project site disturbance and size of project site.

1.4.1 Masonry Units

Cover and protect masonry units from precipitation. Conform to handling and storage requirements of TMS MSJC.

a. Pack masonry units in the manufacturer's standard paper cartons, trays, or shrink wrapped pallets with a divider between each unit. Do not stack pallets. Do not remove units from cartons until cartons are placed on scaffolds or in the location where units are to be laid.

b. Mark prefabricated lintels on top sides to show either the lintel schedule number or the number and size of top and bottom bars.

1.4.2 Reinforcement, Anchors, and Ties

Store steel reinforcing bars, coated anchors, ties, and joint reinforcement above the ground. Maintain steel reinforcing bars and uncoated ties free of loose mill scale and loose rust.

1.4.3 Cementitious Materials, Sand and Aggregates

Deliver cementitious and other packaged materials in unopened containers,

plainly marked and labeled with manufacturers' names and brands. Store cementitious material in dry, weathertight enclosures or completely cover. Handle cementitious materials in a manner that will prevent the inclusion of foreign materials and damage by water or dampness. Store sand and aggregates in a manner to prevent contamination and segregation.

## 1.5 PROJECT/SITE CONDITIONS

Conform to TMS MSJC for hot and cold weather masonry erection.

### 1.5.1 Hot Weather Procedures

When ambient air temperature exceeds 100 degrees F, or exceeds 90 degrees F and the wind velocity is greater than 8 mph, comply with TMS MSJC Article 1.8 D for: preparation prior to conducting masonry work; construction while masonry work is in progress; and protection for newly completed masonry.

### 1.5.2 Cold Weather Procedures

When ambient temperature is below 40 degrees F, comply with TMS MSJC Article 1.8 C for: preparation prior to conducting masonry work; construction while masonry work is in progress; and protection for newly completed masonry.

# PART 2 PRODUCTS

## 2.1 SYSTEM DESCRIPTION

### 2.1.1 Design - Specified Compressive Strength of Masonry

The specified compressive strength of masonry, f'm, is 1900.

### 2.1.2 Performance - Verify Masonry Compressive Strength

Verify specified compressive strength of masonry using the "Unit Strength Method" of TMS MSJC. Submit calculations and certifications of unit and mortar strength.

Verify specified compressive strength of masonry using the "Prism Test Method" of TMS MSJC when the "Unit Strength Method" cannot be used. Submit test results.

## 2.2 MANUFACTURED UNITS

### 2.2.1 General Requirements

Do not change the source of materials, which will affect the appearance of the finished work, after the work has started except with Contracting Officer's approval. Submit test reports from an approved independent laboratory. Certify test reports on a previously tested material as the same materials as that proposed for use in this project. Submit certificates of compliance stating that the materials meet the specified requirements.

2.2.2 Concrete Units

2.2.2.1 Concrete Masonry Units (CMU)

2.2.2.1.1 Cement

Use only cement that has a low alkali content and is of one brand.

2.2.2.1.2 Recycled Content

Provide units with a minimum of 10 percent post-consumer recycled content, or a minimum of 40 percent post-industrial recycled content, based on mass, cost, or volume.Units may contain post-consumer or post-industrial recycled content.

2.2.2.1.3 Size

Provide units with specified dimension of 8 inches wide, 8 inches high, and 16 inches long nominal.

2.2.2.1.4 Surfaces

Provide units with exposed surfaces that are smooth and of uniform texture.

2.2.2.1.5 Unit Types

a. Hollow Load-Bearing Units: ASTM C90, lightweight normal weight. Provide load-bearing units for load-bearing walls.

2.3 EQUIPMENT

2.3.1 Vibrators

Maintain at least one spare vibrator on site at all times.

2.3.2 Grout Pumps

Pumping through aluminum tubes is not permitted.

2.4 MATERIALS

2.4.1 Mortar Materials

2.4.1.1 Cementitious Materials

Provide cementitious materials that conform to those permitted by ASTM C270.

2.4.1.2 Hydrated Lime and Alternates

Provide lime that conforms to one of the materials permitted by ASTM C207 for use in combination with portland cement, hydraulic cement, and blended hydraulic cement. Do not use lime in combination with masonry cement or mortar cement.

2.4.1.3 Admixtures for Masonry Mortar

In cold weather, use a non-chloride based accelerating admixture that conforms to ASTM C1384, unless Type III portland cement is used in the

mortar.

2.4.1.4 Aggregate and Water

Provide aggregate (sand) and water that conform to materials permitted by ASTM C270.

2.4.2 Grout and Ready-Mix Grout Materials

2.4.2.1 Cementitious Materials for Grout

Provide cementitious materials that conform to those permitted by ASTM C476.

2.4.2.2 Admixtures for Grout

Water-reducing admixtures that conform to ASTM C494/C494M Type F or G and viscosity-modifying admixtures that conform to ASTM C494/C494M Type S are permitted for use in grout. Other admixtures require approval by the Contracting Officer.

In cold weather, a non-chloride based accelerating admixture may be used subject to approval by the Contracting Officer; use accelerating admixture that is non-corrosive and conforms to ASTM C494/C494M, Type C.

2.4.2.3 Aggregate and Water

Provide fine and coarse aggregates and water that conform to materials permitted by ASTM C476.

2.5 MORTAR AND GROUT MIXES

2.5.1 Mortar Mix

a. Provide mortar Type S unless specified otherwise herein.

b. Provide mortar that conforms to ASTM C270.

c. For field-batched mortar, measure component materials by volume. Use measuring boxes for materials that do not come in packages, such as sand, for consistent batching. Mix cementitious materials and aggregates between 3 and 5 minutes in a mechanical batch mixer with a sufficient amount of water to produce a workable consistency. Do not hand mix mortar unless approved by the Contracting Officer. Maintain workability of mortar by remixing or retempering. Discard mortar that has begun to stiffen or is not used within 2-1/2 hours after initial mixing.

d. For preblended mortar, follow manufacturer's mixing instructions.

2.5.2 Grout and Ready Mix Grout Mix

Use grout that conforms to ASTM C476, fine . Use conventional grout with a slump between 8 and 11 inches. Use self-consolidating grout with slump flow of 24 to 30 inches and a visual stability index (VSI) not greater than 1. Provide minimum grout strength of 2000 psi in 28 days, as tested in accordance with ASTM C1019. Do not change proportions and do not use materials with different physical or chemical characteristics in grout for the work unless additional evidence is furnished that grout meets the specified requirements. Use ready-mixed grout that conforms to ASTM C476.

## 2.6 ACCESSORIES

### 2.6.1 Grout Barriers

Grout barriers for vertical cores that consist of fine mesh wire, fiberglass, or expanded metal.

### 2.6.2 Anchors, Ties, and Bar Positioners

#### 2.6.2.1 General

a. Fabricate joint reinforcement in conformance with ASTM A951/A951M. Hot dip galvanize joint reinforcement in exterior walls and in interior walls exposed to moist environment in conformance with ASTM A153/A153M. Galvanize joint reinforcement in other interior walls in conformance with ASTM A641/A641M; coordinate with paragraph JOINT REINFORCEMENT below.

b. Submit two anchors, ties and bar positioners of each type used, as samples.

#### 2.6.2.2 Adjustable Anchors

##### 2.6.2.2.1 Anchorage to Structural Steel

Provide hot-dip galvanized adjustable anchors and strap veneer ties for connecting masonry walls and veneer to structural steel and lintel angles, as required, and as detailed on the drawings. Anchors and ties shall have a capacity, in both tension and compression, for the span indicated, as required by design for the indicated controlling wall wind pressures. Straps shall be a minimum of 7/8" wide and 1/8" thick, and shall have a minimum 90-degree 3/4" return on the masonry end, for embedment in vertical mortar joints. Spacing of anchors shall be as required by design, but shall not exceed 16 inches on center. Welding of straps and anchors shall be as required by design. Submit test data or calculations to demonstrate the capacity of the anchors and ties. Provide zinc-rich paint for touching up paint after welding galvanized anchors to structural steel.

#### 2.6.2.3 Bar Positioners

Factory-fabricate bar positioners, used to prevent displacement of reinforcing bars during the course of construction, from 9 gauge steel wire or equivalent, and hot-dip galvanized. Bar positioners must be suitable for intended use and be corrosion resistant steel. Bar positioners not fully contained within the wythe must be hot-dip galvanized.

### 2.6.3 Joint Reinforcement

Factory fabricate joint reinforcement in conformance with ASTM A951/A951M, welded construction. Provide ladder type joint reinforcement, having one longitudinal wire in the mortar bed of each face shell for hollow units and one wire for solid units and with all wires a minimum of 9 gauge. Size joint reinforcement to provide a minimum of 5/8 inch cover from each face. Space crosswires not more than 16 inches. Provide joint reinforcement for straight runs in flat sections not less than 10 feet long. Provide joint reinforcement with factory formed corners and intersections. If approved for use, joint reinforcement may be furnished

with adjustable wall tie features. Submit one piece of each type used, including corner and wall intersection pieces, showing at least two cross wires.

2.6.4 Reinforcing Steel Bars

Reinforcing steel bars and rods shall conform to ASTM A615/A615M or ASTM A996/A996M, Grade 60.

PART 3 EXECUTION

3.1 EXAMINATION

Prior to start of work, verify the applicable conditions as set forth in TMS MSJC, inspection.

3.2 PREPARATION

3.2.1 Stains

Protect exposed surfaces from mortar and other stains. When mortar joints are tooled, remove mortar from exposed surfaces with fiber brushes and wooden paddles. Protect base of walls from splash stains by covering adjacent ground with sand, sawdust, or polyethylene.

3.2.2 Loads

Do not apply uniform loads for at least 12 hours or concentrated loads for at least 72 hours after masonry is constructed. Provide temporary bracing as required.

3.2.3 Concrete Surfaces

Where masonry is to be placed, clean concrete of laitance, dust, dirt, oil, organic matter, or other foreign materials and slightly roughen to provide a surface texture with a depth of at least 1/8 inch. Sandblast, if necessary, to remove laitance from pores and to expose the aggregate.

3.2.4 Bracing

Provide bracing and scaffolding necessary for masonry work. Design bracing to resist wind pressure as required by OSHA and local codes and submit bracing calculations, sealed by a registered professional engineer. Do not remove bracing in less than 10 days.

3.3 ERECTION

3.3.1 General

a. Coordinate masonry work with the work of other trades to accommodate built-in items and to avoid cutting and patching. Lay masonry units in running bond pattern. Adjust each unit to its final position while mortar is still soft and has plastic consistency.

b. Remove and clean units that have been disturbed after the mortar has stiffened, and relay with fresh mortar. Keep expansion joints, and spaces to be grouted free from mortar and other debris. Select units to be used in exposed masonry surfaces from those having the least amount of chipped edges or other imperfections detracting from the

appearance of the finished work.

c. When necessary to temporarily discontinue the work, step (rack) back the masonry for joining when work resumes. Toothing may be used only when specifically approved by the Contracting Officer. Before resuming work, remove loose mortar and thoroughly clean the exposed joint. Cover the top of walls subjected to rain or snow with nonstaining waterproof covering or membrane when work is not in process. Extend the covering a minimum of 610 mm 2 feet down on each side of the wall and hold securely in place.

d. Ensure that units being laid and surfaces to receive units are free of water film and frost. Lay solid units in a nonfurrowed full bed of mortar. Bevel mortar for veneer wythes and slope down toward the cavity side. Shove units into place so that the vertical joints are tight. Completely fill vertical joints between solid units with mortar, except where indicated at control, expansion, and isolation joints. Place hollow units so that mortar extends to the depth of the face shell at heads and beds, unless otherwise indicated. Mortar will be permitted to protrude up to 1/2 inch into the space or cells to be grouted. Provide means to prevent mortar from dropping into the space below or clean grout spaces prior to grouting.

3.3.1.1 Jointing

Tool mortar joints when the mortar is thumbprint hard. Tool horizontal joints after tooling vertical joints. Brush mortar joints to remove loose and excess mortar.

3.3.1.1.1 Tooled Joints

Tool mortar joints in exposed exterior and interior masonry surfaces concave, using a jointer that is slightly larger than the joint width so that complete contact is made along the edges of the unit. Perform tooling so that the mortar is compressed and the joint surface is sealed. Use a jointer of sufficient length to obtain a straight and true mortar joint. No exterior joints are to be left un-tooled.

3.3.1.1.2 Flush Joints

Flush cut mortar joints in concealed masonry surfaces and joints at electrical outlet boxes in wet areas. Finish flush cut joints by cutting off the mortar flush with the face of the wall. Point joints in unparged masonry walls below grade tight. For architectural units, such as fluted units, completely fill both the head and bed joints and flush cut.

3.3.1.1.3 Joint Widths

a. Construct brick masonry with mortar joint widths equal to the difference between the specified and nominal dimensions of the unit, within tolerances permitted by TMS MSJC.

b. Provide 3/8 inch wide mortar joints in concrete masonry, except for prefaced concrete masonry units.

c. Provide 3/8 inch wide mortar joints on unfaced side of prefaced concrete masonry units and not less than 3/16 inch nor more than 1/4 inch wide on prefaced side.

d. Maintain mortar joint widths within tolerances permitted by TMS MSJC

3.3.1.2 Cutting and Fitting

Use full units of the proper size wherever possible, in lieu of cut units. Locate cut units where they would have the least impact on the architectural aesthetic goals of the facility. Perform cutting and fitting, including that required to accommodate the work of others, by masonry mechanics using power masonry saws. Concrete masonry units may be wet or dry cut. Before being placed in the work, dry wet-cut units to the same surface-dry appearance as uncut units being laid in the wall. Provide cut edges that are clean, true and sharp.

a. Carefully make openings in the masonry so that wall plates, cover plates or escutcheons required by the installation will completely conceal the openings and will have bottoms parallel with the masonry bed joints. Provide reinforced masonry lintels above openings over 12 inches wide for pipes, ducts, cable trays, and other wall penetrations, unless steel sleeves are used.

b. Do not reduce masonry units in size by more than one-third in height and one-half in length. Do not locate cut products at ends of walls, corners, and other openings.

3.3.1.3 Unfinished Work

Rack back unfinished work for joining with new work. Toothing may be resorted to only when specifically approved by the Contracting Officer. Remove loose mortar and thoroughly clean the exposed joints before laying new work.

3.3.1.4 Control Joints

Provide control joints in concrete masonry as indicated. Construct by using open end stretcher units placed with the closed end at the joint. Form a continuous vertical joint at control joint locations, including through bond beams, by utilizing half blocks in alternating courses on each side of the joint. Interrupt the control joint key in courses containing continuous bond beam reinforcement.

Where mortar was placed in the joint, rake both faces of the control joints to a depth of 3/4 inch. Install backer rod and sealant on both faces in accordance with Section 07 92 00 JOINT SEALANTS.

3.3.2 Reinforced, Single Wythe Concrete Masonry Units Walls

3.3.2.1 Concrete Masonry Unit Placement

a. Fully bed units used to form starting courses on floor slabs, lintels, and where cells are to be filled with grout in mortar under both face shells and webs. Provide mortar beds under both face shells for other units. Mortar head joints for a distance in from the face of the unit not less than the thickness of the face shell.

3.3.2.2 Preparation for Reinforcement

Lay units in such a manner as to preserve the unobstructed vertical continuity of cores to be grouted. Remove mortar protrusions extending 1/2 inch or more into cells before placing grout. Position reinforcing

bars accurately as indicated before placing grout. Where vertical reinforcement occurs, fill cores solid with grout in accordance with paragraph PLACING GROUT in this Section.

## 3.4 INSTALLATION

### 3.4.1 Bar Reinforcement Installation

#### 3.4.1.1 Preparation

Submit detail drawings showing bar splice locations. Identify bent bars on a bending diagram and reference and locate such bars on the drawings. Show wall dimensions, bar clearances, and wall openings. Utilize bending details that conform to the requirements of ACI SP-66. No approval will be given to the shop drawings until the Contractor certifies that all openings, including those for mechanical and electrical service, are shown. If, during construction, additional masonry openings are required, resubmit the approved shop drawings with the additional openings shown along with the proposed changes. Clearly highlight location of these additional openings. Provide wall elevation drawings with minimum scale of 1/4 inch per foot. Submit drawings including plans, elevations, and details of wall reinforcement; details of reinforcing bars at corners and wall intersections; offsets; tops, bottoms, and ends of walls; control and expansion joints; lintels; and wall openings.

Clean reinforcement of loose, flaky rust, scale, grease, mortar, grout, and other coatings that might destroy or reduce its bond prior to placing grout. Do not use bars with kinks or bends not shown on the approved shop drawings. Place reinforcement prior to grouting. Unless otherwise indicated, extend vertical wall reinforcement to within 2 inches of tops of walls.

#### 3.4.1.2 Positioning Bars

a. Accurately place vertical bars within the cells at the positions indicated on the drawings. A minimum clearance of 1/2 inch shall be maintained between the bars and masonry units. Provide minimum clearance between parallel bars of 1/2 inch between the bars and masonry units for coarse grout and a minimum clearance of 1/4 inch between the bars and masonry units for fine grout. Provide minimum clearance between parallel bars of 1 inch or one diameter of the reinforcement, whichever is greater. Vertical reinforcement may be held in place using bar positioners located near the ends of each bar and at intermediate intervals of not more than 192 diameters of the reinforcement or by other means to prevent displacement beyond permitted tolerances. As masonry work progresses, secure vertical reinforcement to prevent displacement beyond allowable tolerances.

c. Position horizontal reinforcing bars as indicated. Stagger splices in adjacent horizontal bars, unless otherwise indicated.

d. Form splices by lapping bars as indicated. Do not cut, bend or eliminate reinforcing bars. Foundation dowel bars may be field-bent when permitted by TMS MSJC.

#### 3.4.1.3 Splices of Bar Reinforcement

Lap splice reinforcing bars as indicated. When used, provide welded or mechanical connections that develop at least 125 percent of the specified

yield strength of the reinforcement.

3.4.2 Placing Grout

3.4.2.1 General

Fill cells containing reinforcing bars with grout. Solidly grout hollow masonry units in walls or partitions supporting plumbing, heating, or other mechanical fixtures, voids at door and window jambs, and other indicated spaces. Solidly grout cells under lintel bearings on each side of openings for full height of openings. Solidly grout walls below grade, lintels, and bond beams. Units other than open end units may require grouting each course to preclude voids in the units.

Discard site-mixed grout that is not placed within 1-1/2 hours after water is first added to the batch or when the specified slump is not met without adding water after initial mixing. Discard ready-mixed grout that does not meet the specified slump without adding water other than water that was added at the time of initial discharge. Allow sufficient time between grout lifts to preclude displacement or cracking of face shells of masonry units. Provide a grout shear key between lifts when grouting is delayed and the lower lift loses plasticity. If blowouts, flowouts, misalignment, or cracking of face shells should occur during construction, tear down the wall and rebuild.

3.4.2.2 Horizontal Grout Barriers

Embed horizontal grout barriers in mortar below cells of hollow units receiving grout.

3.4.2.3 Cleanouts

3.4.2.3.1 Cleanouts for Hollow Unit Masonry Construction

For hollow masonry units. provide cleanout holes at the bottom of every grout pour in cores containing vertical reinforcement when the height of the grout pour exceeds 5 feet 4 inches. Where all cells are to be grouted, construct cleanout courses using bond beam units in an inverted position to permit cleaning of all cells.

Establish a new series of cleanouts if grouting operations are stopped for more than 4 hours. Provide cleanouts not less than 3 by 3 inch by cutting openings in one face shell. Manufacturer's standard cutout units may be used at the Contractor's option. Do not cleanout holes until masonry work, reinforcement, and final cleaning of the grout spaces have been completed and inspected. For walls which will be exposed to view, close cleanout holes in an approved manner to match surrounding masonry.

3.4.2.4 Grout Placement

A grout pour is the total height of masonry to be grouted prior to erection of additional masonry. A grout lift is an increment of grout placement within a grout pour. A grout pour is filled by one or more lifts of grout.

a. Lay masonry to the top of a pour permitted by TMS MSJC Table 7, based on the size of the grout space and the type of grout. Prior to grouting, remove masonry protrusions that extend 1/2 inch or more into cells or spaces to be grouted. Provide grout holes and cleanouts in

accordance with paragraph GROUT HOLES AND CLEANOUTS above when the grout pour height exceeds 5 feet 4 inches. Hold reinforcement, bolts, and embedded connections rigidly in position before grouting is started. Do not prewet concrete masonry units.

b. Place grout using a hand bucket, concrete hopper, or grout pump to fill the grout space without segregation of aggregate. Operate grout pumps to produce a continuous stream of grout without air pockets, segregation, or contamination.

c. If the masonry has cured at least 4 hours, grout slump is maintained between 10 to 11 inches, and no intermediate reinforced bond beams are placed between the top and bottom of the pour height, place conventional grout in lifts not exceeding 12 feet 8 inches. For the same curing and slump conditions but with intermediate bond beams, limit conventional grout lift to the bottom of the lowest bond beam that is more than 5 feet 4 inches above the bottom of the lift, but do not exceed 12 feet 8 inches. If masonry has not cured at least 4 hours or grout slump is not maintained between 10 to 11 inches, place conventional grout in lifts not exceeding 5 feet 4 inches.

d. Consolidate conventional grout lift and reconsolidate after initial settlement before placing next lift. For grout pours that are 12 inches or less in height, consolidate and reconsolidate grout by mechanical vibration or puddling. For grout pours that are greater than 12 inches in height, consolidate and reconsolidate grout by mechanical vibration. Apply vibrators at uniformly spaced points not further apart than the visible effectiveness of the machine. Limit duration of vibration to time necessary to produce satisfactory consolidation without causing segregation. If previous lift is not permitted to set, dip vibrator into previous lift. Do not insert vibrators into lower lifts that are in a semi-solidified state. If lower lift sets prior to placement of subsequent lift, form a grout key by terminating grout a minimum of 1-1/2 inch below a mortar joint. Vibrate each vertical cell containing reinforcement in partially grouted masonry. Do not form grout keys within beams.

e. If the masonry has cured 4 hours, place self-consolidating grout (SCG) in lifts not exceeding the pour height. If masonry has not cured for at least 4 hours, place SCG in lifts not exceeding 5 feet 4 inches. Do not mechanically consolidate self-consolidating grout. Place self-consolidating grout in accordance with manufacturer's recommendations.

f. Upon completion of each day's grouting, remove waste materials and debris from the equipment, and dispose of outside the masonry.

3.4.3 Joint Reinforcement Installation

Install joint reinforcement at 16 inches on center unless otherwise indicated. Lap joint reinforcement not less than 6 inches. Install prefabricated sections at corners and wall intersections. Place the longitudinal wires of joint reinforcement in mortar beds to provide not less than 5/8 inch cover to either face of the unit.

3.4.4 Bond Beams

Reinforce and grout bond beams as indicated and as described in paragraphs above. Install grout barriers under bond beam units to retain the grout

as required, unless wall is fully grouted or solid bottom units are used. For high lift grouting in partially grouted masonry, provide grout retaining material on the top of bond beams to prevent upward flow of grout. Ensure that reinforcement is continuous, including around corners, except through control joints, unless otherwise indicated.

## 3.5 APPLICATION

### 3.5.1 Bearing Plates

Set bearing plates for beams and similar structural members to the proper line and elevation with non-shrink grout. Provide non-shrink grout as specified in Section 05 12 00 STRUCTURAL STEEL.

### 3.5.2 Tolerances

Lay masonry plumb, true to line, with courses level within the tolerances of TMS MSJC, Article 3.3 F.

## 3.6 FIELD QUALITY CONTROL

### 3.6.1 Tests

#### 3.6.1.1 Field Testing of Mortar

For each required mortar test, provide a minimum of three mortar samples. Perform initial mortar testing prior to construction for comparison purposes during construction.

Prepare and test mortar samples for mortar aggregate ratio in accordance with ASTM C780 Appendix A4. Prepare and test mortar compressive strength specimens in accordance with ASTM C780 Appendix A6.

#### 3.6.1.2 Field Testing of Grout

a. For each required grout property to be evaluated, provide a minimum of three specimens.

b. Sample and test conventional and self-conslidating grout for compressive strength and temperature in accordance with ASTM C1019.

c. Evaluate slump in conventional grout in accordance with ASTM C1019.

d. Evaluate slump flow and visual stability index of self-consolidating grout in accordance with ASTM C1611/C1611M.

## 3.7 POINTING AND CLEANING

After mortar joints have attained their initial set, but prior to hardening, completely remove mortar and grout daubs and splashings from masonry-unit surfaces that will be exposed or painted. Before completion of the work, rake out defects in joints of masonry to be exposed or painted, fill with mortar, and tool to match existing joints. Immediately after grout work is completed, remove scum and stains that have percolated through the masonry work using a low pressure stream of water and a stiff bristled brush. Do not clean masonry surfaces, other than removing excess surface mortar, until mortar in joints has hardened. Leave masonry surfaces clean, free of mortar daubs, dirt, stain, and discoloration, including scum from cleaning operations, and with tight mortar joints

throughout. Do not use metal tools and metal brushes for cleaning.

### 3.7.1 Dry-Brushing Concrete Masonry

Dry brush exposed concrete masonry surfaces at the end of each day's work and after any required pointing, using stiff-fiber bristled brushes.

## 3.8 CLOSE-OUT TAKE-BACK PROGRAM

Collect information from manufacturer for take-back program options. Set aside masonry units, full and partial,scrap, packaging to be returned to manufacturer for recycling into new product. When such a service is not available, seek local recyclers to reclaim the materials. Submit documentation that includes contact information, summary of procedures, and the limitations and conditions applicable to the project. Indicate manufacturer's commitment to reclaim materials for recycling and/or reuse.

## 3.9 PROTECTION

Protect facing materials against staining. Cover top of walls with nonstaining waterproof covering or membrane to protect from moisture intrusion when work is not in progress. Continue covering the top of the unfinished walls until the wall is waterproofed with a complete roof or parapet system. Extend covering a minimum of 2 feet down on each side of the wall and hold securely in place. Before starting or resuming work, clean top surface of masonry in place of loose mortar and foreign material.

CAST STONE INSTITUTE

Technical Manual Current Edition

1.2 DEFINITIONS

Cast Stone - A refined architectural concrete building unit manufactured to simulate natural cut stone, used in unit masonry applications.

1. Dry Cast Concrete Products – manufactured from zero slump concrete. Vibrant Dry Tamp (VDT) casting method: Vibratory ramming of earth moist, zero-slump concrete against a rigid mold until it is densely compacted.

2. Wet Cast Concrete Products – manufactured from measurable slump concrete. Wet casting method: manufactured from measurable slump concrete and vibrated into a mold until it becomes densely consolidated.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Cast stone unit; G, DO

Shop drawings shall include all cast stone unit types. See paragraph 1.6.1 for listing of information required on shop drawings.

SD-03 Product Data

Cast Stone Units; G, DO

SD-08 Manufacturer's Instructions

Installation of cast stone units

Cleaning of cast stone units

Include cast stone manufacturer's written recommendations for installation and cleaning.

1.4 MODIFICATION OF REFERENCES

In the referenced ACI publications, consider the advisory provisions to be mandatory, as though the word "shall" had been substituted for the words "should" or "could" or "may," wherever they appear. Interpret reference to the "Building Official," the "Structural Engineer," and the "Architect/Engineer" to mean the Contracting Officer.

1.5 DELIVERY, STORAGE, AND HANDLING

Deliver packaged materials to the project site in the original, unbroken

packages or containers, each bearing a label clearly identifying manufacturer's name, weight or volume, and other pertinent information. Store packaged materials, and materials in containers, in a weathertight and dry place until ready for use.

1.6 QUALITY ASSURANCE

1.6.1 Cast Stone Unit Drawings

a. Cast stone unit dimensions, cross-section, and edge details; location, size, and type of reinforcement, including reinforcement necessary for safe handling and setting. Drawings shall indicate drips and wash surfaces. Comply with ACI 315.

b. Layout, dimensions, and identification of cast stone units, corresponding to installation sequence.

c. Setting drawings, instructions, and directions for installation of concrete inserts.

d. Location and details of anchorage devices and lifting devices embedded in precast units (where required), and connection details to building structure.

1.6.2 Standards

Comply with the requirements of the Cast Stone Institute Technical Manual and the project specifications. The manufacturer of the cast stone units shall be a current member of the Cast Stone Institute with ten years experience in the manufacture of cast stone. Where a conflict may occur, the contract documents shall prevail.

PART 2 PRODUCTS

2.1 ARCHITECTURAL CAST STONE

2.1.1 Design Requirements

Stone Type: Ledge Stone, Color: "Blue Spruce Ledge" as manufactured by Sunset Stone, (800) 598-8918, www.sunsetstone.net. Manufacturers and materials specified are not intended to limit the selection of equal colors from other manufacturers. An equivalent product and color by another manufacturer may be submitted for approval. Average thickness of 1 1/2 inches plus or minus.

Cast stone sills/wainscot caps shall have a profile 3 inches high by 3 inches deep with a 2 inches high face, with a sloping top surface for positive drainage. Color shall be manufacturer's standard white concrete color.

Cast stone coping at half height patio wall shall have a profile as shown on the drawings. Color shall be manufacturer's standard white concrete color.

Cast stone caps at entrance columns shall have profile approximately 3 5/8 inches high by 8 inches deep with a sloping top surface for positive drainage. Color shall be manufacturer's standard white concrete color.

Provide cast stone transition pieces where cast stone coping at patio wall

intersects cast stone wainscot caps for a smooth transition of slopes.

2.1.2 Physical Properties

ASTM C1364. Provide the following:

1. Compressive Strength - ASTM C1194: 6,500 psi minimum for products at 28 days.

2. Absorption - ASTM C1195: 6% maximum by the cold water method, or 10% maximum by the boiling method for products at 28 days.

3. Air Content – ASTM C173 or ASTM C231, for wet cast product shall be 4-8% for units exposed to freeze-thaw environments. Air entrainment is not required for VDT products.

4. Freeze-thaw – ASTM C666/C666M in accordance with ASTM C1364. The CPWL shall be less than 5.0% after 300 cycles of freezing and thawing.

5. Linear Drying Shrinkage – ASTM C426: Test and report in accordance with ASTM C1364..

2.2 MATERIALS

2.2.1 Fine Aggregates

ASTM C33/C33M, except for gradation. Manufactured or natural sand.

2.2.2 Coarse Aggregates

ASTM C33/C33M, except for gradation. Aggregrates shall be quartz, limestone, marble and / or other materials required to produce the referenced color and texture finish.

2.2.3 Portland Cement

Portland cement shall comply with ASTM C150/C150M Type I or Type III and be a combination of white cement and buff cement (equal to that produced by Texas Industries) and proportioned to achieve the referenced color and texture. The portland cement blend shall not consist of fly ash, pozzolan and / or ground slag.

2.2.4 Colors

Inorganic iron oxide pigments, ASTM C979/C979M except that carbon black pigments shall not be used.

2.2.5 Admixtures

ASTM C260/C260M for air-entraining admixtures. Other admixtures: ASTM C494/C494M for water reducing, retarding or accelerating. Certify that admixtures are free of chlorides.

2.2.6 Water

Fresh, clean, and potable.

2.2.7 Reinforcing

ASTM A615/A615M. Reinforcing steel shall be galvanized or epoxy coated when clearance to an exterior face is 1-1/2 inches or less. Reinforce the units as recommended by the CSI Technical Manual and for safe handling and structural stress.

a. Minimum reinforcing shall be 0.25 percent of the cross section area.

b. Panels and similar stones greater than 24 inches in one direction shall be reinforced in that direction. Units less than 24 inches in both their length and width dimension shall be non-reinforced unless otherwise specified.

c. Welded wire fabric shall be A1064/A1064M where applicable for wet cast units. Welded wire fabric reinforcing shall not be used in dry cast products.

2.2.8 Anchoring Devices

All anchors, dowels and other anchoring devices and shims shall be standard building stone anchors commercially available in non-corrosive stainless steel Type 302 or 304.

2.3 CURING

Cure units in a warm curing chamber approximately 100 degrees F at 100 percent relative humidity for approximately 12 hours, or cure in a 100 percent moist environment at a minimum 70 degrees F for 16 hours after casting. Additional yard curing at 95 percent relative humidity shall be 350 degree-days (i.e. 7 days at 50 degrees F or 5 days at 70 degrees F) prior to shipping. Form cured units shall be protected from moisture evaporation with curing blankets or curing compounds after casting.

PART 3 EXECUTION

3.1 INSTALLATION

Verify that all parts of the supporting structure are complete and ready to receive the cast stone units and that site conditions are conducive to proper installation. Install cast stone units and accessories in accordance with approve detail drawings and descriptive data, and as specified below.

3.1.1 Setting Cast Stone Units

Drench units with clean water prior to setting. Fill dowel holes and anchor slots completely with mortar or non-shrink grout. Set units in full bed of mortar, unless otherwise detailed. Rake mortar joints 3/4 inch for pointing. Remove excess mortar from unit faces immediately after setting. Tuck point unit joints to a slight concave profile.

3.1.2 Setting Tolerances

Comply with Cast Stone Institute Technical Manual. Locate cast stone units to accommodate adjacent products, proper joint width, and alignment with adjacent members. Set stones 1/8 inch or less, within the plane of adjacent units. Joints, plus - 1/16 inch, minus - 1/8 inch.

3.1.3 Joints

Provide joints with sealants in accordance with Section 07 92 00 Joint Sealants. Prime ends of units, insert properly sized backing rod and install required sealant.

a. Joint size: At stone/brick/concrete masonry unit joints 3/8 inch. At stone/stone/concrete masonry unit joints in vertical position 1/4 inch (3/8 inch optional). Stone/stone joints exposed on top 3/8 inch.

b. Joint materials: Mortar, Type N, ASTM C 270. Use a full bed of mortar at all bed joints. Flush vertical joints full with mortar. Leave all joints with exposed tops or under relieving angles open for sealant. Leave head joints in copings and projecting components open for sealant.

c. Location of joints: As shown on shop drawings. At control and expansion joints unless otherwise shown.

3.1.4 Protection

Protect exposed-to-view facing from staining and other damage. Do not allow laitance to penetrate, stain, or harden on exposed surfaces.

3.2 CLEANING

Clean exposed-to-view surfaces of cast stone units thoroughly with detergent and water; use a brush to remove foreign matter. Remove stains that remain after washing in accordance with recommendations of the cast stone manufacturer. Surfaces shall be clean and uniform in color.

3.3 INSPECTION AND ACCEPTANCE

Inspect finished installation according to Cast Stone Institute Technical Bulletin #36. Do not field apply water repellant until repair, cleaning, inspection and acceptance is completed. Cast stone units may be rejected for any one of the following product defects or installation deficiencies remaining after repairs and cleaning have been accomplished. "Visible" means visible to a person with normal eyesight when viewed from a distance of 20 feet in broad daylight.

a. Nonconformance to specified tolerances.

b. Visible air voids (bugholes or blowholes).

c. Visible casting lines.

d. Visible form joints.

e. Visible irregularities.

f. Visible stains on panel surfaces.

g. Visible differences between cast stone unit and approved sample.

h. Visible nonuniformity of textures or color.

i. Visible areas of backup concrete bleeding through the facing concrete.

j. Visible foreign material embedded in the face.

k. Visible repairs.

l. Visible reinforcement shadow lines.

m. Visible cracks.

n. Color deviations and / or not matching specified color.

Welding Electrodes and Rods

Certified Welding Inspector

Welding Procedure Specifications (WPS)

## 1.3 QUALITY ASSURANCE

### 1.3.1 Preconstruction Submittals

#### 1.3.1.1 Erection and Erection Bracing Drawings

Submit for record purposes. Indicate the sequence of erection, temporary shoring and bracing. The erection drawings must conform to AISC 303.

### 1.3.2 Fabrication Drawing Requirements

Submit fabrication drawings for approval prior to fabrication. Prepare in accordance with AISC 303, AISC 326 and AISC 325. Fabrication drawings must not be reproductions of contract drawings. Include complete information for the fabrication and erection of the structure's components, including the location, type, and size of bolts, welds, member sizes and lengths, connection details, blocks, copes, and cuts. Use AWS A2.4 standard welding symbols. Clearly highlight any deviations from the details shown on the contract drawings highlighted on the fabrication drawings. Explain the reasons for any deviations from the contract drawings.

### 1.3.3 Certifications

#### 1.3.3.1 Welding Procedures and Qualifications

Prior to welding, submit certification for each welder stating the type of welding and positions qualified for, the code and procedure qualified under, date qualified, and the firm and individual certifying the qualification tests. If the qualification date of the welder or welding

operator is more than 6 months old, the welding operator's qualification certificate must be accompanied by a current certificate by the welder attesting to the fact that he has been engaged in welding since the date of certification, with no break in welding service greater than 6 months.

Conform to all requirements specified in AWS D1.1/D1.1M .

## PART 2 PRODUCTS

### 2.1 SYSTEM DESCRIPTION

Provide the structural steel system, including shop primer , complete and ready for use. Provide structural steel systems including design, materials, installation, workmanship, fabrication, assembly, erection, inspection, quality control, and testing in accordance with AISC 303, AISC 360, and UFC 3-301-01 except as modified in this contract.

### 2.2 STEEL

#### 2.2.1 Structural Steel

Wide flange and WT shapes, ASTM A992/A992M. Angles, Channels and Plates, ASTM A36/A36M.

### 2.3 BOLTS, NUTS, AND WASHERS

Submit the certified manufacturer's mill reports which clearly show the applicable ASTM mechanical and chemical requirements together with the actual test results for the supplied fasteners.

#### 2.3.1 Common Grade Bolts

##### 2.3.1.1 Bolts

ASTM A307, Grade A, plain finish . The bolt heads and the nuts of the supplied fasteners must be marked with the manufacturer's identification mark, the strength grade and type specified by ASTM specifications.

##### 2.3.1.2 Nuts

ASTM A563, Grade A, heavy hex style.

##### 2.3.1.3 Washers

ASTM F844.

#### 2.3.2 High-Strength Bolts

High strength bolts and nuts must be shipped together in the same shipping container.

##### 2.3.2.1 Bolts

ASTM F3125/F3125M, Grade A325M A325 , Type 1 Heavy Hex Head Style, plain finish .

##### 2.3.2.2 Nuts

ASTM A563, Grade and Style as specified in the applicable ASTM bolt

standard.

2.3.2.3 Washers

ASTM F436/F436M, plain carbon steel.

2.3.3 Anchorage in Masonry

2.3.3.1 Anchor Rods

ASTM F1554 Gr 36 55, Class 1A.

2.3.3.2 Anchor Nuts

ASTM A563, Grade A, hex style.

2.3.3.3 Anchor Washers

ASTM F844.

2.3.3.4 Anchor Plate Washers

ASTM A36/A36M.

2.4 STRUCTURAL STEEL ACCESSORIES

2.4.1 Welding Electrodes and Rods

AWS D1.1/D1.1M. Submit product data for welding electrodes and rods.

2.4.2 Non-Shrink Grout

ASTM C1107/C1107M, with no ASTM C827/C827M shrinkage. Submit product data for non-shrink grout.

2.4.3 Welded Shear Stud Connectors

ASTM A29/A29M, Grades 1010 through 1020. AWS D1.1/D1.1M, Table 7.1, Type B.

2.5 FABRICATION

Fabrication must be in accordance with the applicable provisions of AISC 325. Fabrication and assembly must be done in the shop to the greatest extent possible. Punch, subpunch and ream, or drill bolt holes perpendicular to the surface of the member.

2.5.1 Markings

Prior to erection, identify members by a painted erection mark. Connecting parts assembled in the shop for reaming holes in field connections must be match marked with scratch and notch marks. Do not locate erection markings on areas to be welded. Do not locate match markings in areas that will decrease member strength or cause stress concentrations.

2.5.2 Shop Primer

SSPC Paint 20 or SSPC Paint 29, (zinc rich primer). Shop prime structural

steel, except as modified herein, in accordance with SSPC PA 1. Do not prime steel surfaces embedded in concrete, or surfaces within 0.5 inch of the toe of the welds prior to welding (except surfaces on which metal decking is to be welded). If flash rusting occurs, re-clean the surface prior to application of primer. Apply primer toto a minimum dry film thickness of 2.0 mil. Submit shop primer product data.

2.5.2.1 Cleaning

SSPC SP 6/NACE No.3, except steel exposed in spaces above ceilings, attic spaces, furred spaces, and chases that will be hidden to view in finished construction may be cleaned to SSPC SP 3 when recommended by the shop primer manufacturer. Maintain steel surfaces free from rust, dirt, oil, grease, and other contaminants through final assembly.

PART 3 EXECUTION

3.1 ERECTION

For low-rise structural steel buildings ( 60 feet tall or less and a maximum of 2 stories), erect the structure in accordance with AISC DESIGN GUIDE 10.

After final positioning of steel members, provide full bearing under bearing plates using nonshrink grout. Place nonshrink grout in accordance with the manufacturer's instructions.

3.1.1 STORAGE

Store the material out of contact with the ground in such manner and location as to minimize deterioration.

3.2 CONNECTIONS

Except as modified in this section, design connections indicated in accordance with AISC 360. Build connections into existing work. Do not tighten anchor bolts set in concrete with impact torque wrenches. Holes must not be cut or enlarged by burning. Bolts, nuts, and washers must be clean of dirt and rust, and lubricated immediately prior to installation.

3.2.1 Common Grade Bolts

Tighten ASTM A307 bolts to a "snug tight" fit. "Snug tight" is the tightness that exists when plies in a joint are in firm contact. If firm contact of joint plies cannot be obtained with a few impacts of an impact wrench, or the full effort of a man using a spud wrench, contact the Contracting Officer for further instructions.

3.2.2 High-Strength Bolts

High-strength bolts, if used as a part of the structural steel work not associated with metal building framing, shall only be installed as "snug tightened" joints, in accordance with AISC 360.

Fastener components shall be protected from dirt and moisture in closed containers at the site of the installation. Fastener components that are not incorporated into the work shall be returned to protected storage at the end of the work shift.

## 3.3 GAS CUTTING

Use of gas-cutting torch in the field for correcting fabrication errors is not permitted on any major member in the structural framing. Use of a gas cutting torch will be permitted on minor members not under stress only after approval has been obtained from the Contracting Officer.

## 3.4 WELDING

Welding must be in accordance with AWS D1.1/D1.1M Grind exposed welds smooth as indicated. Provide AWS D1.1/D1.1M qualified welders, welding operators, and tackers.

Develop and submit the Welding Procedure Specifications (WPS) for all welding, including welding done using prequalified procedures. Submit for approval all WPS, whether prequalified or qualified by testing.

### 3.4.1 Removal of Temporary Welds, Run-Off Plates, and Backing Strips

## 3.5 SHOP PRIMER REPAIR

Repair shop primer in accordance with the paint manufacturer's recommendation for surfaces damaged by handling, transporting, cutting, welding, or bolting.

### 3.5.1 Field Priming

Field prime steel exposed to the weather, or located in building areas without HVAC for control of relative humidity. After erection, the field bolt heads and nuts, field welds, and any abrasions in the shop coat must be cleaned and primed with paint of the same quality as that used for the shop coat.

## 3.6 FIELD QUALITY CONTROL

Perform field tests, and provide labor, equipment, and incidentals required for testing . Notify the Contracting Officer in writing of defective welds, bolts, nuts, and washers within 7 working days of the date of the inspection.

### 3.6.1 Welds

#### 3.6.1.1 Visual Inspection

AWS D1.1/D1.1M. Furnish the services of AWS-certified welding inspectors for fabrication and erection inspection and testing and verification inspections. A Certified Welding Inspector must perform visual inspection on 100 percent of all welds. Document this inspection in the Visual Weld Inspection Log. Submit certificates indicating that certified welding inspectors meet the requirements of AWS QC1.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29, SUSTAINABITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Fabrication Drawings; G, DO

SD-03 Product Data

Accessories

Deck Units

Galvanizing Repair Paint

Mechanical Fasteners

Touch-Up Paint

Welding Equipment

Welding Rods and Accessories

SD-05 Design Data

Deck Units; G, DO

SD-07 Certificates

Powder-Actuated Tool Operator

Welder Qualifications

Welding Procedures

Manufacturer's Certificate

1.3 QUALITY ASSURANCE

1.3.1 Deck Units

Furnish deck units and accessory products from a manufacturer regularly engaged in manufacture of steel decking. Provide manufacturer's certificates attesting that the decking material meets the specified requirements.

### 1.3.2 Certification of Powder-Actuated Tool Operator

Provide manufacturer's certificate attesting that the operators are authorized to use the low velocity powder-actuated tool.

### 1.3.3 Qualifications for Welding Work

Follow Welding Procedures of AWS D1.3/D1.3M for sheet steel welding. Submit qualified Welder Qualifications in accordance with AWS D1.3/D1.3M for sheet steel welding, or under an equivalent approved qualification test. Perform tests on test pieces in positions and with clearances equivalent to those actually encountered. If a test weld fails to meet requirements, perform an immediate retest of two test welds until each test weld passes. Failure in the immediate retest will require the welder be retested after further practice or training, performing a complete set of test welds.

Submit manufacturer's catalog data for Welding Equipment and Welding Rods and Accessories.

### 1.3.4 Fabrication Drawings

Show type and location of units, location and sequence of connections, bearing on supports, methods of anchoring, attachment of accessories, adjusting plate details, metal closure strips, size and location of holes to be cut and reinforcement to be provided, the manufacturer's erection instructions and other pertinent details.

## 1.4 DELIVERY, STORAGE, AND HANDLING

Deliver deck units to the site in a dry and undamaged condition. Store and handle steel deck in a manner to protect it from corrosion, deformation, and other types of damage. Do not use decking for storage or as working platform until units have been fastened into position. Exercise care not to damage material or overload decking during construction. The maximum uniform distributed storage load must not exceed the design live load. Stack decking on platforms or pallets and cover with weathertight ventilated covering. Elevate one end during storage to provide drainage. Maintain deck finish at all times to prevent formation of rust. Repair deck finish using touch-up paint. Replace damaged material.

## 1.5 DESIGN REQUIREMENTS FOR ROOF DECKS

### 1.5.1 Properties of Sections

Properties of metal roof deck sections must comply with engineering design width as limited by the provisions of AISI D100.

### 1.5.2 Allowable Loads

Indicate total uniform dead and live load for detailing purposes.

# PART 2 PRODUCTS

## 2.1 DECK UNITS

Submit manufacturer's design calculations, or applicable published

literature for the structural properties of the proposed deck units.

### 2.1.1 Composite Deck

Conform to ASTM A653/A653M or ASTM A1008/A1008M for composite deck assembly. Fabricate deck used as the tension reinforcing in composite deck ofsteel with integrally embossed or raised pattern ribs. The steel design thickness and section properties shall be as required by the design drawings, as a minimum. Zinc-coat in conformance with ASTM A653/A653M, G90 coating class.

### 2.1.2 Length of Deck Units

Provide deck units of sufficient length to span three or more spacings where possible.

### 2.1.3 Touch-Up Paint

Provide a high zinc-dust content paint for regalvanizing welds in galvanized steel conforming to ASTM A780/A780M.

Provide touch-up paint for zinc-coated units of an approved galvanizing repair paint with a high-zinc dust content. Maintain finish of deck units and accessories by using touch-up paint whenever necessary to prevent the formation of rust.

## 2.2 ACCESSORIES

Provide accessories of same material as deck, unless specified otherwise. Provide manufacturer's standard type accessories, as specified.

### 2.2.1 Adjusting Plates

Provide adjusting plates, or segments of deck units, of same thickness and configuration as deck units in locations too narrow to accommodate full size units. Provide factory cut plates of predetermined size where possible.

### 2.2.2 End Closures

Fabricated of sheet metal by the deck manufacturer. Provide end closures minimum 0.0295 inch thick to close open ends at openings through deck.

### 2.2.3 Partition Closures

Provide closures for closing voids above interior walls and partitions that are perpendicular to the direction of the configurations. Provide rubber, plastic, or sheet steel closures above typical partitions. Provide sheet steel closures above fire-resistant interior walls and partitions located on both sides of wall or partition.

### 2.2.4 Closure Plates for Composite Deck

Support and retain concrete at each floor level. Provide edge closures at all edges of the slab as shown, or of sufficient strength and stiffness to support the wet concrete, where not indicated. Provide metal closures for all openings in composite steel deck 1/4 inch and over.

2.2.5 Sheet Metal Collar

Where deck is cut for passage of pipes, ducts, columns, etc., and deck is to remain exposed, provide a neatly cut sheet metal collar to cover edges of deck. Do not cut deck until after installation of supplemental supports.

2.2.6 Column Closures

Sheet metal, minimum 0.0358 inch thick or metal rib lath.

2.2.7 Access Hole Covers

Sheet metal, minimum 0.0474 inch thick.

2.2.8 Hanger

Provide clips or loops for utility systems and suspended ceilings of one or more of the following types:

a. Lip tabs or integral tabs where noncellular decking and a structural concrete fill is used over deck.

b. Decking manufacturer's standard as approved by the Contracting Officer.

2.2.9 Mechanical Fasteners

Provide mechanical fasteners, such as powder actuated fasteners, pneumatically driven fasteners or self-drilling screws, for anchoring the deck to structural supports and adjoining units as indicated.

2.2.10 Miscellaneous Accessories

Furnish the manufacturer's standard accessories to complete the deck installation. Furnish metal accessories of the same material as the deck and with the minimum design thickness as follows: welding washers, 0.0598 inch other metal accessories, 0.0358 inch unless otherwise indicated.

PART 3 EXECUTION

3.1 EXAMINATION

Prior to installation of decking units and accessories, examine worksite to verify that as-built structure will permit installation of decking system without modification.

3.2 INSTALLATION

Install steel deck units in accordance with 29 CFR 1926, Subpart R – Steel Erection, ANSI/SDI QA/QC, ANSI/SDI Cand approved shop drawings. Place units on structural supports, properly adjusted, leveled, and aligned at right angles to supports before permanently securing in place. Damaged deck and accessories including material which is permanently stained or contaminated, deformed, or with burned holes shall not be installed. Extend deck units over three or more supports unless absolutely impractical. Report inaccuracies in alignment or leveling to the Contracting Officer and make necessary corrections before permanently anchoring deck units. Locate deck ends over supports only. Lap 2 inch deck ends. Do not use unanchored deck units as a work or storage platform. Do not fill unanchored deck with concrete. Permanently anchor

units placed by the end of each working day. Do not support suspended ceilings, light fixtures, ducts, utilities, or other loads by steel deck unless indicated. Distribute loads by appropriate means to prevent damage.

3.2.1 Attachment

Immediately after placement and alignment, and after correcting inaccuracies, permanently fasten steel deck units to structural supports and to adjacent deck units by welding with normal 5/8 inchdiameter puddle welds, as indicated on the design drawings and in accordance with manufacturer's recommended procedure and ANSI/SDI C. Clamp or weight deck units to provide firm contact between deck units and structural supports while performing welding . Anchoring the deck to structural supports with powder-actuated fasteners or pneumatically driven fasteners is prohibited. Attachment of adjacent deck units by button-punching is prohibited.

3.2.1.1 Welding

Perform welding in accordance with AWS D1.3/D1.3M using methods and electrodes recommended by the manufacturers of the base metal alloys being used. Ensure only operators previously qualified by tests prescribed in AWS D1.3/D1.3M make welds. Immediately recertify, or replace qualified welders, that are producing unsatisfactory welding. Location, size, and spacing of fastening for deck is indicated on the drawings. Do not use welding washers at sidelaps. Holes and similar defects will not be acceptable. Attach all partial or segments of deck units to structural supports in accordance with Section 2.5 of SDI DDM04. Immediately clean welds by chipping and wire brushing. Heavily coat welds, cut edges and damaged portions of coated finish with zinc-dust paint conforming to ASTM A780/A780M.

3.2.1.2 Mechanical Fastening

Anchor deck to adjoining units with mechanical fasteners. Drive the powder-actuated fasteners with a low-velocity piston tool by an operator authorized by the manufacturer of the powder-actuated tool. Drive pneumatically fasteners with a low-velocity fastening tool and comply with the manufacturer's recommendations. Drive screws to properly clamp deck.

3.2.1.3 Sidelap Fastening

Lock sidelaps between adjacent floor deck units together by screws as indicated.

3.2.2 Openings

Cut or drill all holes and openings required and be coordinated with the drawings, specifications, and other trades. Frame and reinforce openings through the deck in conformance with SDI DDP. Reinforce holes and openings 6 to 12 inch across by 0.0474 inch thick steel sheet at least 12 inch wider and longer than the opening and be fastened to the steel deck at each corner of the sheet and at a maximum of 6 inch on center. Deck manufacturer shall approve holes or openings larger than 6 inch in diameter prior to drilling or cutting.

3.2.3 Deck Damage

SDI MOC3, for repair of deck damage.

3.2.4 Touch-Up Paint

3.2.4.1 Floor Deck

For floor decking installation, wire brush, clean, and touchup paint the scarred areas on the top and bottom surfaces of the metal floor decking and on the surface of supporting steel members. Include welds, weld scars, bruises, and rust spots for scarred areas. Touched up the galvanized surfaces with galvanizing repair paint. Touch up the painted surfaces with paint for the repair of painted surfaces.

3.2.5 Accessory Installation

3.2.5.1 Adjusting Plates

Provide in locations too narrow to accommodate full-size deck units and install as shown on shop drawings.

3.2.5.2 End Closures

Provide end closure to close open ends of cells at columns, walls, and openings in deck.

3.2.5.3 Column Closures

Provide for spaces between floor decking and columns which penetrate the deck. Field cut closure plate to fit column in the field and tack weld to decking and columns.

3.2.5.4 Access Hole Covers

Provide access whole covers to seal holes cut in decking to facilitate welding of the deck to structural supports.

3.2.5.5 Hangers

Provide as indicated to support utility system and suspended ceilings.

3.2.6 Concrete Work

Prior to placement of concrete, inspect installed decking to ensure that there has been no permanent deflection or other damage to decking. Replace decking which has been damaged or permanently deflected as approved by the Contracting Officer. Place concrete on metal deck in accordance with Construction Practice of ANSI/SDI C.

3.3 FIELD QUALITY CONTROL

3.3.1 Deck Weld Inspection

Visual inspect welds in accordance with AWS D1.3/D1.3M.

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Cover Plates and Frames, Installation Drawings; G, DO

Bollards/Pipe Guards; G, DO

Embedded Angles and Plates, Installation Drawings; G, DO

SD-03 Product Data

Cover Plates and Frames; G, DO

SD-07 Certificates

Certificates of Compliance; G, RO

1.3 QUALIFICATION OF WELDERS

Qualify welders in accordance with AWS D1.1/D1.1M. Use procedures, materials, and equipment of the type required for the work.

1.4 DELIVERY, STORAGE, AND PROTECTION

Protect from corrosion, deformation, and other types of damage. Store items in an enclosed area free from contact with soil and weather. Remove and replace damaged items with new items.

1.5 MISCELLANEOUS REQUIREMENTS

1.5.1 Fabrication Drawings

Submit fabrication drawings showing layout(s), connections to structural system, and anchoring details as specified in AISC 303.

1.5.2 Installation Drawings

Submit templates, erection, and installation drawings indicating thickness, type, grade, class of metal, and dimensions. Show construction details, reinforcement, anchorage, and installation in relation to the building construction.

PART 2 PRODUCTS

2.1 MATERIALS

Provide exposed fastenings of compatible materials (avoid contact of dissimilar metals). Coordinate color and finish with the material to which fastenings are applied. Submit the manufacturer's certified mill reports which clearly show the applicable ASTM mechanical and chemical requirements together with the actual test results for the supplied materials.

2.1.1 Structural Carbon Steel

Provide in accordance with ASTM A36/A36M.

2.1.2 Structural Tubing

Provide in accordance with ASTM A500/A500M.

2.1.3 Steel Pipe

Provide in accordance with ASTM A53/A53M, Type E or S, Grade B.

2.1.4 Fittings for Steel Pipe

Provide standard malleable iron fittings in accordance with ASTM A47/A47M.

2.1.5 Anchor Bolts

Provide in accordance with ASTM F1554. Where exposed, provide anchor bolts of the same material, color, and finish as the metal to which they are applied.

2.1.5.1 Lag Screws and Bolts

Provide in accordance with ASME B18.2.1, type and grade best suited for the purpose.

2.1.5.2 Toggle Bolts

Provide in accordance with ASME B18.2.1.

2.1.5.3 Bolts, Nuts, Studs and Rivets

Provide in accordance with ASME B18.2.2 or ASTM A307.

2.1.5.4 Powder Actuated Fasteners

Follow safety provisions in accordance with ASSE/SAFE A10.3.

2.1.5.5 Screws

Provide in accordance with ASME B18.2.1, ASME B18.6.2, ASME B18.6.3 and ASTM C1513.

2.1.5.6 Washers

Provide plain washers in accordance with ASME B18.22M, ASME B18.21.1. Provide beveled washers for American Standard beams and channels, square or rectangular, tapered in thickness, and smooth. Provide lock washers in accordance with ASME B18.21.2M, ASME B18.21.1.

2.1.5.7 Welded Headed Shear Studs

Provide in accordance with ASTM A108.

2.1.6 Aluminum Alloy Products

Provide in accordance with ASTM B209M, ASTM B209 for sheet plate, ASTM B221M, ASTM B221M, ASTM B221 for extrusions and ASTM B26/B26M or ASTM B108/B108M for castings. Provide aluminum extrusions at least 1/8 inch thick and aluminum plate or sheet at least 0.050 inch thick.

2.2 FABRICATION FINISHES

2.2.1 Galvanizing

Hot-dip galvanize items specified to be zinc-coated, after fabrication where practicable. Provide galvanizing in accordance with ASTM A123/A123M, ASTM A153/A153M, ASTM A653/A653M or ASTM A924/A924M, Z275 G90.

2.2.2 Galvanize

Anchor bolts, washers, and parts or devices necessary for proper installation, unless indicated otherwise.

2.2.3 Repair of Zinc-Coated Surfaces

Repair damaged surfaces with galvanizing repair method and paint in accordance with ASTM A780/A780M or by application of stick or thick paste material specifically designed for repair of galvanizing, as approved by

Contracting Officer. Clean areas to be repaired and remove slag from welds. Heat, with a torch, surfaces to which stick or paste material will be applied. Heat to a temperature sufficient to melt the metals in the stick or paste. Spread molten material uniformly over surfaces to be coated and wipe off excess material.

2.2.4 Shop Cleaning and Painting

2.2.4.1 Surface Preparation

Blast clean surfaces in accordance with SSPC SP 6/NACE No.3. Surfaces that will be exposed in spaces above ceiling or in attic spaces, crawl spaces, furred spaces, and chases may be cleaned in accordance with SSPC SP 3 in lieu of being blast cleaned. Wash cleaned surfaces which become contaminated with rust, dirt, oil, grease, or other contaminants with solvents until thoroughly clean. Steel to be embedded in concrete must be free of dirt and grease prior to embed. Do not paint or galvanize bearing surfaces, including contact surfaces within slip critical joints. Shop coat these surfaces with rust prevention.

2.2.4.2 Pretreatment, Priming and Painting

Apply pre-treatment, primer, and paint in accordance with manufacturer's printed instructions. On surfaces concealed in the finished construction or not accessible for finish painting, apply an additional prime coat to a minimum dry film thickness of 1.0 mil. Tint additional prime coat with a small amount of tinting pigment.

2.2.5 Nonferrous Metal Surfaces

Protect by plating, anodic, or organic coatings.

2.2.6 Aluminum Surfaces

2.2.6.1 Surface Condition

Before finishes are applied, remove roll marks, scratches, rolled-in scratches, kinks, stains, pits, orange peel, die marks, structural streaks, and other defects which will affect uniform appearance of finished surfaces.

2.2.6.2 Aluminum Finishes

Unexposed sheet, plate and extrusions may have mill finish as fabricated. Sandblast castings' finish, medium, AA DAF45. Unless otherwise specified, provide all other aluminum items with a standard mill finish. Provide a coating thickness not less than that specified for protective and decorative type finishes for items used in interior locations or architectural Class I type finish for items used in exterior locations. Provide in accordance with AA DAF45. Provide a polished satin finish on items to be anodized.

2.3 COVER PLATES AND FRAMES

Fabricate cover plates of 1/4 inch thick rolled steel weighing not more than 100 pounds per plate with a selected raised pattern nonslip top surface. Provide galvanized plate. Reinforce to sustain a live load of 150 pounds per square foot. Provide structural steel shapes and plates for frames, with bent steel bars or headed anchors welded to frame for

anchoring to concrete. Miter and weld all corners. Butt joint straight runs. Provide holes for lifting tools. Remove sharp edges and burrs from cover plates and exposed edges of frames. Weld all connections and grind top surface smooth. Weld bar stops every six inches. Provide 1/8 inch clearance at edges and between cover plates.

## 2.4 BOLLARDS/PIPE GUARDS

Provide galvanized and prime coated extra strong weight steel pipe in accordance with ASTM A53/A53M for pipe bollards. Provide bollards where indicated, and embed in concrete or anchor to footings as indicated in details. See Architectural Floor Plan for location

## 2.5 MISCELLANEOUS PLATES AND SHAPES

Provide items that do not form a part of the structural steel framework, such as lintels, sill angles, miscellaneous mountings and frames.

Provide angles and plates in accordance with ASTM A36/A36M, for embedment as indicated. Galvanize embedded items exposed to the elements in accordance with ASTM A123/A123M.

# PART 3 EXECUTION

## 3.1 GENERAL INSTALLATION REQUIREMENTS

Install items at locations indicated in accordance with manufacturer's instructions. Verify all field dimensions prior to fabrication. Include materials and parts necessary to complete each assembly, whether indicated or not. Miss-alignment and miss-sizing of holes for fasteners is cause for rejection. Conceal fastenings where practicable. Joints exposed to weather must be watertight.

## 3.2 WORKMANSHIP

Provide miscellaneous metalwork that is true and accurate in shape, size, and profile. Make angles and lines continuous and straight. Make curves consistent, smooth and unfaceted. Provide continuous welding along the entire area of contact except where tack welding is permitted. Do not tack weld exposed connections. Unless otherwise indicated and approved, provide a smooth finish on exposed surfaces. Provide countersuck rivets where exposed. Provide coped and mitered corner joints aligned flush and without gaps.

## 3.3 ANCHORAGE, FASTENINGS, AND CONNECTIONS

Provide anchorage as necessary, whether indicated or not, for fastening miscellaneous metal items securely in place. Include slotted inserts, expansion shields, powder-driven fasteners, toggle bolts (when approved for concrete), headed shear studs, machine and carriage bolts for steel, through bolts, lag bolts, and screws for wood. Do not use wood plugs. Provide non-ferrous attachments for non-ferrous metal. Provide exposed fastenings of compatible materials (avoid contact of dissimilar metals), that generally match in color and finish the surfaces to which they are applied. Conceal fastenings where practicable. Provide all fasteners flush with the surfaces they fasten, unless indicated otherwise.

## 3.4 BUILT-IN WORK

Where necessary and not otherwise indicated, form built-in metal work for anchorage with concrete or masonry. Provide built-in metal work in ample time for securing in place as the work progresses.

## 3.5 WELDING

Perform welding, welding inspection, and corrective welding in accordance with AWS D1.1/D1.1M. Use continuous welds on all exposed connections. Grind visible welds smooth in the finished installation. Provide welded headed shear studs in accordance with AWS D1.1/D1.1M, Clause 7, except as otherwise specified. Provide in accordance with the safety requirements of EM 385-1-1.

## 3.6 DISSIMILAR METALS

Where dissimilar metals are in contact, protect surfaces with a coating in accordance with MPI 79 to prevent galvanic or corrosive action. Where aluminum is in contact with concrete, plaster, mortar, masonry, wood, or absorptive materials subject to wetting, protect in accordance with ASTM D1187/D1187M, asphalt-base emulsion. Clean surfaces with metal shavings from installation at the end of each work day.

## 3.7 PREPARATION

### 3.7.1 Material Coatings and Surfaces

Remove rust preventive coating just prior to field erection, using a remover approved by the metal manufacturer. Surfaces, when assembled, must be free of rust, grease, dirt and other foreign matter.

### 3.7.2 Environmental Conditions

Do not clean or paint surfaces when damp or exposed to foggy or rainy weather, when metallic surface temperature is less than minus 5 degrees F above the dew point of the surrounding air, or when surface temperature is below 45 degrees F or over 95 degrees F, unless approved by the Contracting Officer. Metal surfaces to be painted must be dry for a minimum of 48 hours prior to the application of primer or paint.

## 3.8 COVER PLATES AND FRAMES

Provide tops of cover plates and frames flush with finished surface. Test for trip hazards and adjust for any encountered lippage.

## 3.9 INSTALLATION OF BOLLARDS/PIPE GUARDS

Set bollards/pipe guards vertically in concrete piers as shown, except where detailed to be attached to footings with anchor bolts and to bear on base plates. Fill hollow cores with concrete having a compressive strength of 4500 psi.

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When

used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Underlayment
Fire Retardant Treated Plywood (AM 003)

1.3 DELIVERY AND STORAGE

Deliver materials to the site in an undamaged condition. Store, protect, handle, and install prefabricated structural elements in accordance with manufacturer's instructions and as specified. Store materials off the ground to provide proper ventilation, with drainage to avoid standing water, and protection against ground moisture and dampness. Store materials with a moisture barrier at both the ground level and as a cover forming a well ventilated enclosure. Adhere to requirements for stacking, lifting, bracing, cutting, notching, and special fastening requirements. Do not use materials that have visible moisture or biological growth. Remove defective and damaged materials and provide new materials. Store separated reusable wood waste convenient to cutting station and area of work.

1.4 GRADING AND MARKING

1.4.1 Lumber

Mark each piece of framing and board lumber or each bundle of small pieces of lumber with the grade mark of a recognized association or independent inspection agency. Such association or agency must be certified by the Board of Review, American Lumber Standards Committee, to grade the species used. Surfaces that are to be exposed to view must not bear grademarks, stamps, or any type of identifying mark. Hammer marking will be permitted on timbers when all surfaces will be exposed to view.

1.4.2 Plywood

Mark each sheet with the mark of a recognized association or independent inspection agency that maintains continuing control over the quality of the plywood. The mark must identify the plywood by species group or span rating, exposure durability classification, grade, and compliance with APA L870. Surfaces that are to be exposed to view must not bear grademarks or other types of identifying marks.

1.4.3 Structural-Use and OSB Panels

Mark each panel with the mark of a recognized association or independent inspection agency that maintains continuing control over the quality of the panel. The mark must indicate end use, span rating, and exposure durability classification. Oriented Strand Board (OSB), APA F405.

1.4.4 Preservative-Treated Lumber and Plywood

The Contractor is responsible for the quality of treated wood products. Each treated piece must be inspected in accordance with AWPA M2 and permanently marked or branded, by the producer, in accordance with AWPA M6. The Contractor must provide Contracting Officer's Representative (COR)

with the inspection report of an approved independent inspection agency that offered products comply with applicable AWPA Standards. The appropriate Quality Mark on each piece will be accepted, in lieu of inspection reports, as evidence of compliance with applicable AWPA treatment standards.

1.4.5 Fire-Retardant Treated Lumber

Mark each piece in accordance with AWPA M6, except pieces that are to be natural or transparent finished. In addition, exterior fire-retardant lumber must be distinguished by a permanent penetrating blue stain. Labels of a nationally recognized independent testing agency will be accepted as evidence of conformance to the fire-retardant requirements of AWPA M6.

1.5 SIZES AND SURFACING

ALSC PS 20 for dressed sizes of yard and structural lumber. Lumber must be surfaced four sides. Size references, unless otherwise specified, are nominal sizes, and actual sizes must be within manufacturing tolerances allowed by the standard under which the product is produced. Other measurements are IP or SI standard.

1.6 MOISTURE CONTENT

Air-dry or kiln-dry lumber. Kiln-dry treated lumber after treatment. Maximum moisture content of wood products must be as follows at the time of delivery to the job site:

a. Framing lumber and board, 19 percent maximum

b. Timbers 5 inches and thicker, 25 percent maximum

c. Materials other than lumber; moisture content must be in accordance with standard under which the product is produced

1.7 PRESERVATIVE TREATMENT

Treat wood products with waterborne wood preservatives conforming to AWPA P5. Pressure treatment of wood products must conform to the requirements of AWPA BOOK Use Category System Standards U1 and T1. Pressure-treated wood products must not contain arsenic, chromium, or other agents classified as carcinogenic, probably carcinogenic, or possibly carcinogenic to humans (compounds in Groups 1, 2A, or 2B) by the International Agency for Research on Cancer (IARC), Lyon, France. Pressure-treated wood products must not exceed the limits of the U.S. EPA's Toxic Characteristic Leaching Procedure (TCLP), and must not be classified as hazardous waste. Submit certification from treating plant stating chemicals and process used and net amount of preservatives retained are in conformance with specified standards. In accordance with AWPA U1 provide non-copper preservative treatment such as EL2, PTI or SBX,DOT for products in direct contact with sheet metal.

a. 0.25 pcf intended for above ground use.

b. 0.40 pcf intended for ground contact and fresh water use. 0.60 pcf intended for Ammoniacal Copper Quaternary Compound (ACQ)-treated foundations. 0.80 to 1.00 pcf intended for ACQ-treated pilings. All wood must be air or kiln dried after treatment. Specific treatments

must be verified by the report of an approved independent inspection agency, or the AWPA Quality Mark on each piece. Do not incise surfaces of lumber that will be exposed. Minimize cutting and avoid breathing sawdust. Brush coat areas that are cut or drilled after treatment with either the same preservative used in the treatment or with a 2 percent copper naphthenate solution. The following items must be preservative treated:

(1) Wood framing, woodwork, and plywood up to and including the subflooring at the first-floor level of structures having crawl spaces when the bottoms of such items are 24 inches or less from the earth underneath.

(2) Wood members that are in contact with water.

(3) Exterior wood steps, platforms, and railings; and all wood framing of open, roofed structures.

(4) Wood sills, soles, plates, furring, and sleepers that are less than 24 inches from the ground, furring and nailers that are set into or in contact with concrete or masonry.

(5) Nailers, edge strips, crickets, curbs, and cants for roof decks.

1.7.1 New Construction

Use a boron-based preservative conforming to AWPA P18, sodium silicate wood mineralization process, or Ammoniacal Copper Quaternary Compound to treat wood. Use boron-based preservatives for above-ground applications only.

1.8 ENVIRONMENTAL REQUIREMENTS

During and immediately after installation of treated wood, engineered wood products, and laminated wood products at interior spaces, provide temporary ventilation.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Virgin Lumber

Lumber fabricated from old growth timber is not permitted. Avoid companies who buy, sell, or use old growth timber in their operations, when possible. Provide certified sustainably harvested virgin lumber.

2.2 PLYWOOD, STRUCTURAL-USE, AND ORIENTED STRAND BOARD (OSB) PANELS

APA L870, APA S350, APA E445, and APA F405 respectively.

2.2.1 Wall Sheathing

2.2.1.1 Plywood

C-D Grade, Exposure 1, and a minimum thickness of 1/2 inch Provide certified sustainably harvested plywood wall sheathing. Provide exterior grade material with phenol resin for interior and exterior applications.

(AM 003) Provide A-C, fire retardant plywood for the telecom room.

2.2.1.2 Structural-Use and OSB Panels

Sheathing grade with durability equivalent to Exposure 1, Span Rating of 24/0 or greater. OSB, APA Rated Sheathing. OSB must be a phenolic-glued board. Provide certified sustainably harvested structural-use and OSB panel wall sheathing.

2.2.2 Other Uses

2.2.2.1 Plywood

Plywood for general use. C-D Grade, Exposure 1. Provide certified sustainably harvested plywood for other uses.

2.2.2.2 Structural-Use and OSB Panels

Structural-use and OSB panels for general use. Sheathing grade with durability equivalent to Exposure 1 and a minimum thickness of 1/2 inch. Provide certified sustainably harvested structural-use and OSB panels for other uses.

2.3 OTHER MATERIALS

2.3.1 Miscellaneous Wood Members

2.3.1.1 Blocking

Blocking must be standard or number 2 grade.

2.3.1.2 Rough Bucks and Frames

Rough bucks and frames must be straight standard or number 2 grade.

2.3.2 Adhesives

Comply with applicable regulations regarding toxic and hazardous materials and as specified. Provide non-aerosol adhesive products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide aerosol adhesives used on the interior of the building meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of GS-36. Provide certification or validation of indoor air quality for non-aerosol adhesives applied on the interior of the building (inside of the weatherproofing system). Provide certification or validation of indoor air quality for aerosol adhesives used on the interior of the building (inside of the weatherproofing system).

2.4 ROUGH HARDWARE

Unless otherwise indicated or specified, rough hardware must be of the type and size necessary for the project requirements. Sizes, types, and spacing of fastenings of manufactured building materials must be as recommended by the product manufacturer unless otherwise indicated or specified. Rough hardware exposed to the weather or embedded in or in

contact with preservative treated wood, exterior masonry, or concrete walls or slabs must be hot-dip zinc-coated in accordance with ASTM A153/A153M. Nails and fastenings for fire-retardant treated lumber and woodwork exposed to the weather must be copper alloy or hot-dipped galvanized fasteners as recommended by the treated wood manufacturer.

2.4.1 Bolts, Nuts, Studs, and Rivets

ASME B18.2.1, ASME B18.5.2.1M, ASME B18.5.2.2M and ASME B18.2.2.

2.4.2 Anchor Bolts

ASTM A307, size as indicated, complete with nuts and washers.

2.4.3 Expansion Shields

CID A-A-1923, CID A-A-1924, and CID A-A-1925. Except as shown otherwise, maximum size of devices must be 3/8 inch.

2.4.4 Lag Screws and Lag Bolts

ASME B18.2.1.

2.4.5 Wood Screws

ASME B18.6.1.

PART 3 EXECUTION

3.1 INSTALLATION

Do not install building construction materials that show visual evidence of biological growth.

Conform to AWC WFCM and install in accordance with the National Association of Home Builders (NAHB) Advanced Framing Techniques: Optimum Value Engineering, unless otherwise indicated or specified. Select lumber sizes to minimize waste. Fit framing lumber and other rough carpentry, set accurately to the required lines and levels, and secure in place in a rigid manner. Provide as necessary for the proper completion of the work all framing members not indicated or specified.

3.2 MISCELLANEOUS

3.2.1 Wood Blocking

Provide proper sizes and shapes at proper locations for the installation and attachment of wood and other finish materials, fixtures, equipment, and items indicated or specified.

3.3 WASTE MANAGEMENT OF WOOD PRODUCTS

In accordance with the Waste Management Plan and as specified. Separate and reuse scrap sheet materials larger than 2 square feet. Clearly separate damaged wood and other scrap lumber for acceptable alternative uses on site, including bracing, blocking, cripples, ties, and shims.

Separate composite wood from other wood types and recycle or reuse.Coordinate with manufacturer for take-back program and submit

manufacturer's policy statement on program. When such a service is not available, local recyclers must be sought after to reclaim the materials. Fold up metal banding, flatten, and recycle.

Separate treated, stained, painted, and contaminated wood and place in designated area for hazardous materials. Dispose of according to local regulations. Do not leave any wood, shavings, sawdust, or other wood waste buried in fill or on the ground.Do not burn scrap lumber that has been pressure treated, or lumber that is less than one year old.

1.2 SYSTEM DESCRIPTION

Work in this section includes laminate clad custom casework kitchen cabinets as shown on the drawings and as described in this specification. This Section includes high-pressure laminate surfacing and cabinet hardware. Comply with EPA requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING.

1.3 SUSTAINABILITY REPORTING

Materials in this technical specification may contribute towards contract compliance with sustainability requirements. See Section 01 33 29 SUSTAINABILITY REPORTING for project local/regional materials, low-emitting materials, recycled content, certified wood and rapidly renewable materials LEED documentation requirements.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Shop Drawings; G, DO

Shop drawings showing all fabricated casework items in plan view, elevations and cross-sections to accurately indicate materials used, details of construction, dimensions, methods of fastening and erection, and installation methods proposed. Shop drawing casework items shall be clearly cross-referenced to casework items located on the project drawings. Shop drawings shall include a color schedule of all casework items to include all exposed cabinet finishes to include finish material manufacturer, pattern, and color.

## 1.5 QUALITY ASSURANCE

### 1.5.1 General Requirements

Unless otherwise noted on the drawings, all materials, construction methods, and fabrication shall conform to and comply with the premium grade quality standards as outlined in NAAWS 3.1, Section for laminate clad cabinets. These standards shall apply in lieu of omissions or specific requirements in this specification. Contractors and their personnel engaged in the work shall be able to demonstrate successful experience with work of comparable extent, complexity and quality to that shown and specified. Submit a quality control statement which illustrates compliance with and understanding of NAAWS 3.1 requirements, in general, and the specific NAAWS 3.1 requirements provided in this specification. The quality control statement shall also certify a minimum of ten years Contractor's experience in laminate clad casework fabrication and construction.

### 1.5.2 Mock-ups

Prior to final approval of shop drawings, provide a full-size mock-up of a typical kitchen floor cabinet and wall cabinet, including all components and hardware necessary to illustrate a completed unit with a minimum of one door and one drawer assembly. The completed mock-up shall include countertops and back splashes where specified. The mock-up shall utilize specified finishes in the patterns and colors as indicated in Section 09 06 00 SCHEDULES FOR FINISHES. Upon disapproval, rework or remake the mock-up until approval is secured. Remove rejected units from the jobsite. Approved mock-up may remain as part of the finished work.

### 1.5.3 Sustainable Design Certification

Product shall be third party certified in accordance with ULE Greenguard Gold, SCS Scientific Certification Systems Indoor Advantage Gold or equal. Certification shall be performed annually and shall be current.

## 1.6 DELIVERY, STORAGE, AND HANDLING

Casework may be delivered knockdown or fully assembled. Deliver all units to the site in undamaged condition, stored off the ground in fully enclosed areas, and protected from damage. The storage area shall be well ventilated and not subject to extreme changes in temperature or humidity.

## 1.7 SEQUENCING AND SCHEDULING

Coordinate work with other trades. Units shall not be installed in any room or space until painting, and ceiling installation are complete within the room where the units are located. Floor cabinets shall be installed before finished flooring materials are installed.

# PART 2 PRODUCTS

## 2.1 WOOD MATERIALS

### 2.1.1 Lumber

All framing lumber shall be kiln-dried Grade III to dimensions as shown on the drawings.

2.1.2 Panel Products

2.1.2.1 Plywood

All plywood panels used for framing purposes shall be veneer core hardwood plywood, NAAWS 3.1 Grade AA. Nominal thickness of plywood panels shall be as indicated in this specification and on the drawings.

2.1.2.2 Particleboard

All particleboard shall be industrial grade, medium density ( 40 to 50 pounds per cubic foot), 3/4 inch thick. A moisture-resistant particleboard in grade Type 2-M-2 or 2-M-3 shall be used as the substrate for solid surface covered countertops backsplashes and components as located on the drawings and other areas subjected to moisture. Particleboard shall meet the minimum standards listed in ASTM D1037 and CPA A208.1.

2.1.2.3 Medium Density Fiberboard

Medium density fiberboard (MDF) shall be an acceptable panel substrate where noted on the drawings. Medium density fiberboard shall meet the minimum standards listed in CPA A208.2.

2.2 SOLID POLYMER MATERIAL

Solid surfacing casework components shall conform to the requirements of Section 06 61 16 SOLID SURFACING FABRICATIONS.

2.3 HIGH PRESSURE DECORATIVE LAMINATE (HPDL)

All plastic laminates shall meet the requirements of ANSI/NEMA LD 3 and ANSI A161.2 for high-pressure decorative laminates. Design, colors, surface finish and texture, and locations shall be as indicated on the drawings and Section 09 06 00 SCHEDULES FOR FINISHES. Submit two samples of each plastic laminate pattern and color. Samples shall be a minimum of 5 by 7 inches in size. Plastic laminate types and nominal minimum thicknesses for casework components shall be as indicated in the following paragraphs.

2.3.1 Horizontal General Purpose Standard (HGS) Grade

Horizontal general purpose standard grade plastic laminate shall be 0.048 inches (plus or minus 0.005 inches) in thickness. This laminate grade is intended for horizontal surfaces where postforming is not required.

2.3.2 Backing Sheet (BK) Grade

Undecorated backing sheet grade laminate is formulated specifically to be used on the backside of plastic laminated panel substrates to enhance dimensional stability of the substrate. Backing sheet thickness shall be 0.020 inches. Backing sheets shall be provided for all laminated casework components where plastic laminate finish is applied to only one surface of the component substrate.

2.4 THERMOSET DECORATIVE OVERLAYS (MELAMINE)

Thermoset decorative overlays (melamine panels) shall be used for casework cabinet interior, drawer interior, and all semi-exposed surfaces.

## 2.5 EDGE BANDING

Edge banding for casework doors and drawer fronts shall be PVC vinyl and shall be 0.125 inch thick. Material width shall be 15/16 inches or as indicated on the drawings. Color and pattern shall match exposed door and drawer front laminate pattern and color.

## 2.6 CABINET HARDWARE

Submit one sample of each cabinet hardware item specified to include hinges, pulls, drawer glides, and adjustable shelf hardware. All hardware shall conform to ANSI/BHMA A156.9, unless otherwise noted, and shall consist of the following components:

### 2.6.1 Door Hinges

Frameless Euro-Style concealed type, BHMA No. B01602, back mounted, opening to 165 degrees.

### 2.6.2 Cabinet Pulls

Surface Mounted Pull type, BHMA No. B02011. Style shall be bar pull style with cross sectional diameter of not less than 7/16 inch. Pulls shall project not less than 1-1/4 inches. Stainless steel or satin nickel finish.

### 2.6.3 Drawer Slide

Side mounted type, BHMA No. B05051 with full extension and a minimum 100 pound load capacity. Slides shall include an positive stop to avoid accidental drawer removal.

### 2.6.4 Adjustable Shelf Support System

Multiple holes with metal pin supports.

## 2.7 FASTENERS

Nails, screws, and other suitable fasteners shall be the size and type best suited for the purpose and shall conform to ASTM F547 where applicable.

## 2.8 ADHESIVES, CAULKS, AND SEALANTS

### 2.8.1 Adhesives

Adhesives shall be of a formula and type recommended by AWI. Adhesives shall be selected for their ability to provide a durable, permanent bond and shall take into consideration such factors as materials to be bonded, expansion and contraction, bond strength, fire rating, and moisture resistance. Adhesives shall meet local regulations regarding VOC emissions and off-gassing.

#### 2.8.1.1 Wood Joinery

Adhesives used to bond wood members shall be a Type II for interior use polyvinyl acetate resin emulsion . Adhesives shall withstand a bond test as described in ANSI/WDMA I.S.1A.

2.8.1.2 Laminate Adhesive

Adhesive used to join high-pressure decorative laminate to wood shall be a water-based contact adhesiveadhesive consistent with AWI and laminate manufacturer's recommendations. PVC edgebanding shall be adhered using a polymer-based hot melt glue.

2.8.2 Caulk

Caulk used to fill voids and joints between laminated components and between laminated components and adjacent surfaces shall be clear, 100 percent silicone.

2.8.3 Sealant

Sealant shall be of a type and composition recommended by the substrate manufacturer to provide a moisture barrier at sink cutouts and all other locations where unfinished substrate edges may be subjected to moisture.

2.9 ACCESSORIES

2.9.1 Grommets

Grommets shall be plastic material for cutouts with a diameter of 2 inches. Locations shall be as indicated on the drawings.

2.10 FABRICATION

Verify field measurements as indicated in the shop drawings before fabrication. Fabrication and assembly of components shall be accomplished at the shop site to the maximum extent possible. Construction and fabrication of cabinets and their components shall meet or exceed the requirements for AWI custom grade unless otherwise indicated in this specification. Cabinet style, in accordance with NAAWS 3.1, Section 400-G descriptions, shall be flush overlayas indicated on the drawings.

2.10.1 Base and Wall Cabinet Case Body

2.10.1.1 Cabinet Components

Frame members shall be glued-together, kiln-dried hardwood lumber. Top corners, bottom corners, and cabinet bottoms shall be braced with either hardwood blocks or water-resistant glue and nailed in place metal or plastic corner braces. Cabinet components shall be constructed from the following materials and thicknesses:

2.10.1.1.1 Body Members (Ends, Divisions, Bottoms, and Tops)

3/4 inch particleboard panel product

2.10.1.1.2 Face Frames and Rails

3/4 inch hardwood lumber

2.10.1.1.3 Shelving

3/4 inch particleboardpanel product

2.10.1.1.4 Cabinet Backs

1/4 inch particleboard panel product

2.10.1.1.5 Drawer Sides, Backs, and Subfronts

1/2 inch hardwood lumber

2.10.1.1.6 Drawer Bottoms

1/4 inch veneer core plywood panel product

2.10.1.1.7 Door and Drawer Fronts

3/4-inch medium density fiberboard (MDF) panel product

2.10.1.2 Joinery Method for Case Body Members

2.10.1.2.1 Tops, Exposed Ends, and Bottoms

a. Steel "European" assembly screws ( 1-1/2 inch from end, 5 inch on center, fasteners will not be visible on exposed parts).

b. Doweled, glued under pressure (approx. 4 dowels per 12 inches of joint).

c. Stop dado, glued under pressure, and either nailed, stapled or screwed (fasteners will not be visible on exposed parts).

d. Spline or biscuit, glued under pressure.

2.10.1.2.2 Exposed End Corner and Face Frame Attachment

2.10.1.2.2.1 Mitered Joint

lock miter or spline or biscuit, glued under pressure (no visible fasteners)

2.10.1.2.2.2 Non-Mitered Joint (90 degree)

butt joint glued under pressure (no visible fasteners)

2.10.1.2.2.3 Butt Joint

glued and nailed

2.10.1.2.3 Cabinet Backs (Wall Hung Cabinets)

Wall hung cabinet backs must not be relied upon to support the full weight of the cabinet and its anticipated load for hanging/mounting purposes. Method of back joinery and hanging/mounting mechanisms should transfer the load to case body members. Fabrication method shall be:

2.10.1.2.3.1 Full Bound

Full bound, captured in grooves on cabinet sides, top, and bottom. Cabinet backs for floor standing cabinets shall be side bound, captured in grooves; glued and fastened to top and bottom.

2.10.1.2.3.2 Full Overlay

Full overlay, plant-on backs with minimum back thickness of 1/2 inchand minimum No. 12 plated (no case hardened) screws spaced a minimum 3 inches on center. Edge of back shall not be exposed on finished sides. Anchor strips are not required when so attached.

2.10.1.2.3.3 Side Bound

Side bound, captured in groove or rabbetts; glued and fastened.

2.10.1.2.4 Cabinet Backs (Floor Standing Cabinets)

2.10.1.2.4.1 Side Bound

Side bound, captured in grooves; glued and fastened to top and bottom.

2.10.1.2.4.2 Full Overlay

Full overlay, plant-on backs with minimum back thickness of1/2 inch and minimum No. 12 plated (no case hardened) screws spaced a minimum 3 inches on center. Edge of back shall not be exposed on finished sides. Anchor strips are not required when so attached.

2.10.1.2.4.3 Side Bound with Rabbetts

Side bound, placed in rabbetts; glued and fastened in rabbetts.

2.10.1.2.5 Wall Anchor Strips

Wall Anchor Strips shall be required for all cabinets with backs less than 1/2 inch thick. Strips shall consist of minimum 1/2 inch thick lumber, minimum 2-1/2 inches width; securely attached to wall side of cabinet back - top and bottom for wall hung cabinets, top only for floor standing cabinets.

2.10.2 Cabinet Floor Base

Floor cabinets shall be mounted on a base constructed of nominal 2 inch thick treated lumber. Base assembly components shall be treated lumberand a moisture-resistant panel product. Finished height for each cabinet base shall be as indicated on the drawings. Bottom edge of the cabinet door or drawer face shall be flush with top of base .

2.10.3 Cabinet Door and Drawer Fronts

Door and drawer fronts shall be fabricated from 3/4 inch medium density particleboard. All door and drawer front edges shall be surfaced with PVC edgebanding, color and pattern to match exterior face laminateas indicated in Section 09 06 00 SCHEDULES FOR FINISHES.

2.10.4 Drawer Assembly

2.10.4.1 Drawer Components

Drawer components shall consist of a removable drawer front, sides, backs, and bottom. Drawer components shall be constructed of the following materials and thicknesses:

2.10.4.1.1 Drawer Sides and Back For Thermoset Decorative Overlay (Melamine) Finish

1/2 inch thick medium density particleboard or MDF fiberboard substrate

2.10.4.1.2 Drawer Bottom

1/4 inch thick veneer core panel product for thermoset decorative overlay melamine panel product

2.10.4.2 Drawer Assembly Joinery Method

a. Multiple dovetail (all corners) or French dovetail front/dadoed back, glued under pressure.

b. Doweled, glued under pressure.

c. Lock shoulder, glued and pin nailed.

d. Bottoms shall be set into sides, front, and back, 1/4 inch deep groove with a minimum 3/8 inch standing shoulder.

2.10.5 Shelving

2.10.5.1 General Requirements

Shelving shall be fabricated from 3/4 inch medium density particleboard. All shelving top and bottom surfaces shall be finished with thermoset decorative overlay (melamine). Shelf edges shall be finished in a PVC edgebanding.

2.10.5.2 Shelf Support System

The shelf support system shall be:

2.10.5.2.1 Pin Hole Method

Drill holes on the interior surface of the cabinet side walls. Evenly space holes in two vertical columns Space the holes in each column at 1 inch increments starting 6 inches from the cabinet interior bottom and extending to within 6 inches of the top interior surface of the cabinet. Drill holes to provide a level, stable surface when the shelf is resting on the shelf pins. Coordinate hole diameter with pin insert size to provide a firm, tight fit.

2.10.6 Laminate Application

Laminate application to substrates shall follow the recommended procedures and instructions of the laminate manufacturer and ANSI/NEMA LD 3, using tools and devices specifically designed for laminate fabrication and application. Provide a balanced backer sheet (Grade BK) wherever only one surface of the component substrate requires a plastic laminate finish. Apply required grade of laminate in full uninterrupted sheets consistent with manufactured sizes using one piece for full length only, using adhesives specified herein or as recommended by the manufacturer. Fit corners and joints hairline. All laminate edges shall be machined flush, filed, sanded, or buffed to remove machine marks and eased (sharp corners removed). Clean up at easing shall be such that no overlap of the member eased is visible. Fabrication shall conform to ANSI A161.2. Laminate

types and grades for component surfaces shall be as follows unless otherwise indicated on the drawings:

2.10.6.1 Base/Wall Cabinet Case Body

a. Exterior (exposed) surfaces to include exposed and semi-exposed face frame surfaces: HPDL Grade VGS.

b. Interior (semi-exposed) surfaces to include interior back wall, bottom, and side walls: Thermoset Decorative Overlay (melamine).

2.10.6.2 Adjustable Shelving

2.10.6.2.1 Top and Bottom Surfaces

Thermoset Decorative Overlay (melamine)

2.10.6.2.2 All Edges

Thermoset Decorative Overlay (melamine) PVC edgebanding

2.10.6.3 Fixed Shelving

2.10.6.3.1 Top and Bottom Surfaces

Thermoset Decorative Overlay (melamine)

2.10.6.3.2 Exposed Edges

Thermoset Decorative Overlay (melamine)

2.10.6.4 Door, Drawer Fronts, Access Panels

2.10.6.4.1 Exterior (Exposed) and Interior (Semi-Exposed) Faces

HPDL Grade VGP

2.10.6.4.2 Edges

PVC edgebanding

2.10.6.5 Drawer Assembly

All interior and exterior surfaces: Thermoset Decorative Overlay (melamine).

2.10.6.6 Tolerances

Flushness, flatness, and joint tolerances of laminated surfaces shall meet the NAAWS 3.1 custom grade requirements.

2.10.7 Finishing

2.10.7.1 Filling

No fasteners shall be exposed on laminated surfaces. All nails, screws, and other fasteners in non-laminated cabinet components shall be countersunk and the holes filled with wood filler consistent in color with the wood species.

2.10.7.2 Sanding

All surfaces requiring coatings shall be prepared by sanding with a grit and in a manner that scratches will not show in the final system.

2.10.7.3 Coatings

Types, method of application and location of casework finishes shall be in accordance with the finish schedule, drawings and Section 09 90 00 PAINTS AND COATINGS. All cabinet reveals shall be painted. Submit descriptive data which provides narrative written verification of all types of construction materials and finishes, methods of construction, etc. not clearly illustrated on the submitted shop drawings. Data shall provide written verification of conformance with NAAWS 3.1 for the quality indicated to include materials, tolerances, and types of construction. Both the manufacturer of materials and the fabricator shall submit available literature which describes re-cycled product content, operations and processes in place that support efficient use of natural resources, energy efficiency, emissions of ozone depleting chemicals, management of water and operational waste, indoor environmental quality, and other production techniques supporting sustainable design and products.

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall comply with applicable requirements for NAAWS 3.1 premium quality standards. Countertops and fabricated assemblies shall be installed level, plumb, and true to line, in locations shown on the drawings. Cabinets and other laminate clad casework assemblies shall be attached and anchored securely to the floor and walls with mechanical fasteners that are appropriate for the wall and floor construction.

3.1.1 Anchoring Systems

3.1.1.1 Floor

Base cabinets shall utilize a floor anchoring system. Anchoring and mechanical fasteners shall not be visible from the finished side of the casework assembly. Cabinetassemblies shall be attached to anchored bases without visible fasteners . Where assembly abuts a wall surface, anchoring shall include a minimum 1/2 inch thick lumber or panel product hanging strip, minimum 2-1/2 inch width; securely attached to the top of the wall side of the cabinet back.

3.1.1.2 Wall

Cabinets to be wall mounted shall utilize minimum 1/2 inch thick lumber or panel product hanging strips, minimum 2-1/2 inch width; securely attached to the wall side of the cabinet back, both top and bottom.

3.1.2 Countertops

Countertops shall be installed in locations as indicated on the drawings. Countertops shall be fastened to supporting casework structure with mechanical fasteners, hidden from view. All joints formed by the countertop or countertop splash and adjacent wall surfaces shall be filled with a clear silicone caulk. Loose backand side splashes shall be

adhered to both the countertop surface perimeter and the adjacent wall surface with adhesives appropriate for the type of materials to be adhered. Joints between the countertop surface and splash shall be filled with clear silicone caulk in a smooth consistent concave bead. Bead size shall be the minimum necessary to fill the joint and any surrounding voids or cracks.

### 3.1.3 Hardware

Casework hardware shall be installed in types and locations as indicated on the drawings. Where fully concealed European-style hinges are specified to be used with particleboard or fiberboard doors, the use of plastic or synthetic insertion dowels shall be used to receive 3/16 inch "Euroscrews". The use of wood screws without insertion dowels is prohibited.

### 3.1.4 Doors, Drawers and Removable Panels

The fitting of doors, drawers and removable panels shall be accomplished within target fitting tolerances for gaps and flushness in accordance with NAAWS 3.1 custom grade requirements.

### 3.1.5 Plumbing Fixtures

Install sinks, sink hardware, and other plumbing fixtures in locations as indicated on the drawings and in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

1.2 SYSTEM DESCRIPTION

a. Work under this section includes window sills, lavatories, counter tops, and shower enclosures and other items utilizing solid polymer (solid surfacing) fabrication as shown on the drawings and as described in this specification. Do not change source of supply for materials after work has started, if the appearance of finished work would be affected.

b. In most instances, installation of solid polymer fabricated components and assemblies will require strong, correctly located structural support provided by other trades. To provide a stable, sound, secure installation, close coordination is required between the solid polymer fabricator/installer and other trades to ensure that necessary structural wall support, cabinet counter top structural support, proper clearances, and other supporting components are provided for the installation of wall panels, countertops, and all other solid polymer fabrications to the degree and extent recommended by the solid polymer manufacturer.

c. Appropriate staging areas for solid polymer fabrications. Allow variation in component size and location of openings of plus or minus 1/8 inch.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

## 1.4 CERTIFICATIONS

### 1.4.1 Indoor Air Quality

Submit required indoor air quality certifications and validations in one submittal package.

#### 1.4.1.1 Indoor Air Quality for Solid Surface Fabricated Products

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or provide certification by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

## 1.5 QUALITY ASSURANCE

### 1.5.1 Qualifications

To ensure warranty coverage, solid polymer fabricators must be certified to fabricate by the solid polymer material manufacturer being utilized. Mark all fabrications with the fabricator's certification label affixed in an inconspicuous location. Fabricators must have a minimum of 5 years of experience working with solid polymer materials. Submit solid polymer manufacturer's certification attesting to fabricator qualification

approval.

1.5.2 Detail Drawings

Submit Detail Drawings indicating locations, dimensions, component sizes, fabrication and joint details, attachment provisions, installation details, and coordination requirements with adjacent work.

1.6 DELIVERY, STORAGE, AND HANDLING

Do not deliver materials to project site until areas are ready for installation. Deliver components and materials to the site undamaged, in containers clearly marked and labeled with manufacturer's name. Store materials indoors with adequate precautions taken to prevent damage to finished surfaces. Provide protective coverings to prevent physical damage or staining following installation, for duration of project.

1.7 WARRANTY

Provide manufacturer's warranty of ten years against defects in materials, excluding damages caused by physical or chemical abuse or excessive heat. Provide warranty for material and labor for replacement or repair of defective material for a period of ten years after component installation.

PART 2 PRODUCTS

2.1 MATERIAL

Provide solid polymer material that is a homogeneous filled solid polymer; not coated, laminated or of a composite construction; meeting CSA B45.5-11/IAPMO Z124 requirements. Provide materials with the minimum physical and performance properties specified. Superficial damage to a depth of 0.01 inch must be repairable by sanding or polishing. Provide material thickness as indicated on the drawings. Provide material not less than 1/4 inch in thickness. Submit a minimum 4 by 4 inch sample of each color and pattern for approval. Provide samples that indicate the full range of color and pattern variation. Retain approved samples as the standard for this work throughout the construction duration. Submit test report results from an independent testing laboratory attesting that the submitted solid polymer material meets or exceeds each of the specified performance requirements. Provide materials that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).

Provide certification or validation of indoor air quality for solid surface fabrication products.

2.1.1 Cast, 100 Percent Acrylic Polymer Solid Surfacing Material

Provide cast, 100 percent acrylic solid polymer material composed of acrylic polymer, mineral fillers, and pigments and meeting the following minimum performance requirements:

| PROPERTY | REQUIREMENT (min. or max.) | TEST PROCEDURE |
|---|---|---|
| Tensile Strength | 4000 psi (max.) | ASTM D638 |
| Hardness | 55-Barcol Impressor (min.) | ASTM D2583 |
| Thermal Expansion | .000023 in/in/F (max.) | ASTM D696 |
| Boiling Water Surface Resistance | No Change | ANSI/NEMA LD 3-3.05 |
| High Temperature Resistance | No Change | ANSI/NEMA LD 3-3.06 |
| Impact Resistance (Ball drop) | | ANSI/NEMA LD 3-303 |
| 1/4 inch sheet | 36 inches, 1/2 lb ball, no failure | |
| 1/2 inch sheet | 140 inches, 1/2 lb ball, no failure | |
| 3/4 inch sheet | 200 inches, 1/2 lb ball, no failure | |
| Mold & Mildew Growth | No growth | ASTM G21 |
| Bacteria Growth | No growth | ASTM G21 |
| Liquid Absorption (Weight in 24 hrs.) | 0.1 percent max. | ASTM D570 |
| Flammability | | ASTM E84 |
| Flame Spread | 25 max. | |
| Smoke Developed | 30 max. | |
| Sanitation | "Food Contact" approval | NSF/ANSI 51 |

2.1.2 Acrylic-modified Polymer Solid Surfacing Material

Provide cast, solid polymer material composed of a formulation containing acrylic and polyester polymers, mineral fillers, and pigments. Provide acrylic polymer content not less than 5 percent and not more than 10 percent to meet the following minimum performance requirements:

| PROPERTY | REQUIREMENT (min. or max.) | TEST PROCEDURE |
|---|---|---|
| Tensile Strength | 4100 psi (max.) | ASTM D638 |

| PROPERTY | REQUIREMENT (min. or max.) | TEST PROCEDURE |
|---|---|---|
| Hardness | 50-Barcol Impressor (min.) | ASTM D2583 |
| Thermal Expansion | .000023 in/in/F (max.) | ASTM D696 |
| Boiling Water Surface Resistance | No Change | ANSI/NEMA LD 3-3.05 |
| High Temperature Resistance | No Change | ANSI/NEMA LD 3-3.06 |
| Impact Resistance (Ball drop) | | ANSI/NEMA LD 3-303 |
| 1/4 inch sheet | 36 inches, 1/2 lb ball, no failure | |
| 1/2 inch sheet | 140 inches, 1/2 lb ball, no failure | |
| 3/4 inch sheet | 200 inches, 1/2 lb ball, no failure | |
| Mold & Mildew Growth | No growth | ASTM G21 |
| Bacteria Growth | No growth | ASTM G21 |
| Liquid Absorption (Weight in 24 hrs.) | 0.6 percent max. | ASTM D570 |
| Flammability | | ASTM E84 |
| Flame Spread | 25 max. | |
| Smoke Developed | 100 max. | |
| Sanitation | "Food Contact" approval | NSF/ANSI 51 |

2.1.3 Material Patterns and Colors

Provide patterns and colors for all solid polymer components and fabrications indicated on the project in Section 09 06 00 SCHEDULE FOR FINISHES. Pattern and color must be consistent in appearance, throughout the entire depth (thickness) of the solid polymer material.

2.1.4 Surface Finish

Provide exposed finished surfaces and edges with a uniform appearance. Exposed surface finish must be semigloss; gloss rating of 25-50.

## 2.2 ACCESSORY PRODUCTS

Provide accessory products, as specified below, manufactured by the solid polymer manufacturer or products approved by the solid polymer manufacturer for use with the solid polymer materials being specified.

### 2.2.1 Seam Adhesive

Provide a two-part adhesive kit to create permanent, inconspicuous, non-porous, hard seams and joints by chemical bond between solid polymer materials and components to create a monolithic appearance of the fabrication. Adhesive must be approved by the solid polymer manufacturer and color-matched to the surfaces being bonded where solid-colored, solid polymer materials are being bonded together. Provide clear or color matched seam adhesive where particulate patterned, solid polymer materials are being bonded together.

### 2.2.2 Panel Adhesive

Provide neoprene based panel adhesive meeting TCNA Hdbk, Underwriter's Laboratories (UL) listed. Use this adhesive to bond solid polymer components to adjacent and underlying substrates.

### 2.2.3 Silicone Sealant

Provide a mildew-resistant, FDA and OSHA Nationally Recognized Testing Laboratory (NRTL) listed silicone sealant or caulk in a clear formulation. The silicone sealant must be approved for use by the solid polymer manufacturer. Use sealant to seal all expansion joints between solid polymer components and all joints between solid polymer components and other adjacent surfaces such as walls, floors, ceiling, and plumbing fixtures.

### 2.2.4 Seam and Sealant Emissions

Provide seam and other accessory materials that meet the emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type).

Provide validation of indoor air quality for solid surface seam and sealant products.

### 2.2.5 Mounting Hardware

Provide mounting hardware, including sink/bowl clips, inserts and fasteners for attachment of undermount sinks and lavatories.

## 2.3 FABRICATIONS

Provide factory or shop fabricated components to sizes and shapes indicated, to the greatest extent practical, in accordance with approved Shop Drawings and manufacturer's requirements. Provide factory cutouts for sinks, lavatories, and plumbing fixtures where indicated on the drawings. Contours and radii must be routed to template, with edges smooth. Defective and inaccurate work will be rejected. Submit product data indicating product description, fabrication information, and compliance with specified performance requirements for solid polymer, joint adhesive, sealants, and heat reflective tape.

2.3.1 Joints and Seams

Form joints and seams between solid polymer components using manufacturer's approved seam adhesive. Provide inconspicuous joints in appearance and without voids to create a monolithic appearance.

2.3.2 Edge Finishing

Rout and finish component edges to a smooth, uniform appearance and finish. Provide edge shapes and treatments, including any inserts, as detailed on the drawings. Rout all cutouts, then sand all edges smooth. Repair or reject defective or inaccurate work.

2.3.3 Counter and Vanity Top Splashes

Fabricate backsplashes and end splashes from 1/2 inch thick solid surfacing material to be 4 inches high. Provide backsplashes and end splashes for all counter tops and vanity tops at locations indicated in Section 09 06 00 SCHEDULE FOR FINISHES. Provide shop fabricated loose, to be field attached backsplashes.

2.3.4 Window Stools

Fabricate window stools from 1/2 inch thick solid surfacing, solid polymer material, including dimensions, edge shape, and other details as indicated in Section 09 06 00 SCHEDULE FOR FINISHES.

2.3.5 Counter Tops

Fabricate all solid surfacing, solid polymer counter top and vanity top components from 1/2 inch thick material including details, dimensions, locations, and quantities as indicated on the Drawings. Provide complete counter tops with 4 inch high permanently attached with coved transition backsplash and loose endsplashesat all locations. Attach 2 inch wide reinforcing strip of polymer material under each horizontal counter top seam. Submit a minimum 1 foot wide by 6 inch deep, full size sample for each type of counter top shown on the project drawings. The sample must include the edge profile and backsplash as detailed on the project drawings. Provide solid polymer material of a pattern and color as indicated in 09 06 00 SCHEDULE FOR FINISHES. Provide sample that includes at least one seam and retain approved sample as standard for this work.

2.3.5.1 Counter Top With Sink or Lavatory

a. Stainless Steel Sink. Provide countertops with sinks that include cutouts to template as furnished by the sink manufacturer. Provide manufacturer's standard sink mounting hardware for stainless steel installation. Seal seam between sink and counter top shall be sealed with silicone sealant. Install sink, faucet, and plumbing requirements in accordance with Section 22 00 00 PLUMBING,GENERAL PURPOSE.

b. Provide solid polymer bowls that are a standard product of the solid polymer manufacturer, designed specifically to be installed in solid polymer counter tops. Provide bowls of the same polymer composition as the adjoining counter top. Provide a bowl design that supports a seam adhesive undermount installation method. Provide bowls generally oval in shape, with dimensions of approximately 16 inches wide, 11 inches from front to back, and 5 inches deep.

### 2.3.6 Shower Base and Wall Panel System

Provide shower wall enclosures in a system of solid polymer components to include: panels, corner trim, soap dish, shampoo shelf, panel edge trim, and shower base. Provide dimensions of all components as indicated on the drawings. Panels must be formed from manufacturer's standard 1/4 inch thick sheet product. Provide full width and height panels with seams occurring only at the inside corners of the enclosure. Shower base shall be solid, slip resistant, matte surface, ADA entrance compliant, with end trench drain. Soap dish and shampoo shelf must be of a configuration, shape, and location as standard with the manufacturer's system.

## PART 3 EXECUTION

### 3.1 INSTALLATION

#### 3.1.1 Components

Do not install items that show visual evidence of biological growth. Install all components and fabricated units plumb, level, and rigid. Make field joints between solid polymer components using solid polymer manufacturer's approved seam adhesives, to provide a monolithic appearance with joints inconspicuous in the finished work. Attach metal sinks and lavatory bowls to counter tops using solid polymer manufacturer's recommended clear silicone sealant and mounting hardware. Install all solid polymer sinks and bowls using a color-matched seam adhesive. Install all plumbing connections to sinks and lavatories in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

#### 3.1.2 Wall Panels & Panel Systems

Use a neoprene-based panel adhesive for installation of wall panels and system components to substrates. Use seam adhesive to adhere all solid polymer components to each other with the exception of expansion joints and inside corners. Use a silicone sealant to join all inside corners and expansion joints between solid polymer components. Seal all joints between solid polymer components and non-solid polymer surfaces with a clear silicone sealant.

#### 3.1.3 Silicone Sealant

Use a clear, silicone sealant or caulk to seal all expansion joints between solid polymer components and all joints between solid polymer components and other adjacent surfaces such as walls, floors, ceiling, and plumbing fixtures. Sealant bead must be smooth and uniform in appearance and use the minimum size necessary to bridge any gaps between the solid surfacing material and the adjacent surface. Install continuous bead that runs the entire length of the joint being sealed.

#### 3.1.4 Plumbing

Make plumbing connections to sinks and lavatories in accordance with Section 22 00 00 PLUMBING, GENERAL PURPOSE.

### 3.2 CLEAN-UP

Clean all components after installation and cover to protect against damage during completion of the remaining project items. Components

damaged after installation by other trades will be repaired or replaced at the General Contractor's cost. Component supplier will provide a repair/replace cost estimate to the General Contractor who must approve estimate before repairs are made. Submit a minimum of six copies of maintenance data indicating manufacturer's care, repair and cleaning instructions. Provide maintenance video if available. Submit maintenance kit for matte finishes.

## 1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Block or Board Insulation; G, DO

Vapor Retarder; G, DO

Protection Board or Coatings;

Accessories including sealants;

Recycled Content for Block or Board Insulation;

SD-08 Manufacturer's Instructions G, RO

Block or Board Insulation

Adhesive

## 1.3 MANUFACTURER'S DETAILS

Submit manufacturer's standard details indicating methods of attachment and spacing, transition and termination details, and installation details. Include verification of existing conditions.

## 1.4 PRODUCT DATA

Include data for material descriptions, recommendations for product shelf life, requirements for protection board or coatings, and precautions for flammability and toxicity. Include data to verify compatibility of sealants with insulation.

## 1.5 DELIVERY, STORAGE, AND HANDLING

### 1.5.1 Delivery

Deliver materials to the site in original sealed wrapping bearing manufacturer's name and brand designation, specification number, type, grade, R-value, and class. Store and handle to protect from damage. Do not allow insulation materials to become wet, soiled, crushed, or covered with ice or snow. Comply with manufacturer's recommendations for handling, storing, and protecting of materials before and during installation.

### 1.5.2 Storage

Inspect materials delivered to the site for damage and store out of weather in manufacturer's original packaging. Store only in dry locations, not subject to open flames or sparks, and easily accessible for inspection and handling. Keep materials wrapped and separated from off-gassing materials (such as drying paints and adhesives). Do not use materials that have visible moisture or biological growth. Comply with manufacturer's recommendations for handling, storage, and protection of materials before and during installation.

## 1.6 SAFETY PRECAUTIONS

### 1.6.1 Respirators

Provide installers with dust/mist respirators, training in their use, and protective clothing, all approved by the National Institute for Occupational Safety and Health (NIOSH)/Mine Safety and Health Administration (MSHA) and in accordance with 29 CFR 1910.134.

### 1.6.2 Other Safety Considerations

Comply with the safety requirements of ASTM C930.

# PART 2 PRODUCTS

## 2.1 BLOCK OR BOARD INSULATION

Provide thermal insulating materials as recommended by manufacturer for each type of application indicated. Provide insulation with the following physical properties and in accordance with the following standards:

b. Extruded Preformed Cellular Polystyrene: ASTM C578 REV A

d. Unfaced Preformed Rigid Polyurethane and Polyisocyanurate Board: ASTM C591

e. Faced Rigid Cellular Polyisocyanurate and Polyurethane Insulation: ASTM C1289 REV A

(1) Type I Aluminum Foil on both major surfaces. Class 2 - Glass fiber reinforced core.

(2) Type II Fibrous felt or glass fiber mat membrane on both major surfaces of the core foam.

(3) Type III Perlite insulation board on one major surface of the core foam and a fibrous felt or glass fiber mat membrane on the other major surface of the core foam.

(4) Type IV Cellulosic fiber insulating board on the one major surface of the core foam and fibrous felt or glass fiber mat membrane on the other major surface of the core foam.

(5) Type V Oriented strand board or water board on one major surface of the core foam and fibrous felt or glass fiber mat membrane or aluminum foil on the other major surface of the core foam.

(6) Type VI Perlite insulation board on both major surfaces of the core foam.

2.1.1 Fire Protection Requirements

a. Flame spread index of 75 or less when tested in accordance with ASTM E84.

b. Smoke developed index of 450 or less when tested in accordance with ASTM E84.

c. Provide insulated assemblies in accordance ICC IBC Chapter Fire and Smoke Protection Features.

2.1.2 Other Material Properties

Provide thermal insulating materials with the following properties:

a. Rigid cellular plastics: Compressive Resistance at Yield: Not less than 10 pounds per square inch (psi) when measured according to ASTM D1621.

c. Block-type insulation: Block-type insulation: Flexural strength: Not less than 25 psi when measured according to ASTM C203 REV A.

d. Water Vapor Permeance: Not more than 1.1 Perms or less when measured according to ASTM E96/E96M, desiccant method, in the thickness required to provide the specified thermal resistance, including facings, if any.

e. Water Absorption: Not more than 2 percent by total immersion, by volume, when measured according to ASTM C272/C272M.

f. Water Adsorption: Not more than 1 percent by volume when measured in accordance with paragraph 14 of ASTM C553.

2.1.3 Recycled Materials

Provide thermal insulation containing recycled materials to the extent practicable, provided that the material meets all other requirements of this section. The minimum required recycled material contents (by weight,

not volume) are:

| | |
|---|---|
| Polyisocyanurate/Polyurethane: | 9 percent |
| Phenolic Rigid Foam: | 5 percent |
| Perlite Board: | 75 percent post consumer paper |

Provide data identifying percentage of recycled content for block or board insulation.

2.1.4 Indoor Air Quality

Provide certification of indoor air quality for block or board insulation.

2.1.5 Prohibited Materials

Do not provide materials containing asbestos.

2.2 VAPOR RETARDER AND DAMPPROOFING

2.2.1 Vapor Retarder under Floor Slab

a. Water vapor permeance: 0.2 Perm or less when tested in accordance with ASTM E96/E96M.

b. Puncture resistance: Maximum load no less than 40 pounds when tested according to ASTM E154/E154M REV A.

2.3 PRESSURE SENSITIVE TAPE

As recommended by manufacturer of vapor retarder(s). Match water vapor permeance rating for each vapor retarder specified. Provide tape in accordance with ASTM D3833/D3833M.

2.4 PROTECTION BOARD OR COATING

As recommended by insulation manufacturer.

2.5 ACCESSORIES

2.5.1 Adhesive

As recommended by insulation manufacturer.

2.5.2 Mechanical Fasteners

Corrosion resistant fasteners as recommended by the insulation manufacturer.

PART 3 EXECUTION

3.1 EXISTING CONDITIONS

Prior to installation, ensure all areas that are in contact with the

insulation are dry and free of projections that could cause voids, compressed insulation, or punctured vapor retarders. For foundation perimeter or under slab applications, check that subsurface fill is flat, smooth, dry, and well tamped. Do not proceed with installation if moisture or other conditions are present, and notify the Contracting Officer of such conditions. Do not proceed with the work until conditions have been corrected and verified to be dry.

## 3.2 PREPARATION

### 3.2.1 Blocking Around Heat Producing Devices

Provide noncombustible blocking at all spaces between heat producing devices and the floors, ceilings and roofs through which they pass. Provide in accordance with ICC IBC Section 2111.12 Fireplace Blocking and with the following clearances:

a. Recessed lighting fixtures, including wiring compartments, ballasts, and other heat producing devices, unless certified for installation surrounded by insulation: 3 inches from outside face of fixtures and devices or as required by NFPA 70 and, if insulation is placed above fixture or device, 24 inches above fixture.

b. Vents and vent connectors used for venting products of combustion, flues, and chimneys other than masonry chimneys: Minimum clearances as required by NFPA 211.

c. Gas Fired Appliances: Clearances as required in NFPA 54.

d. Oil Fired Appliances: Clearances as required in NFPA 31.

Blocking is not required if chimneys or flues are certified in writing by the chimney or flue manufacturer for use in contact with specific insulating materials.

## 3.3 INSTALLATION

### 3.3.1 Installation and Handling

Provide insulation in accordance with the manufacturer's printed installation instructions. Keep material dry and free of extraneous materials.

### 3.3.2 Electrical Wiring

Do not install insulation in a manner that would enclose electrical wiring between two layers of insulation.

### 3.3.3 Cold Climate Requirement

Place insulation on the outside of pipes.

### 3.3.4 Continuity of Insulation

Butt tightly against adjoining boards, studs, rafters, joists, sill plates, headers and obstructions. Provide continuity and integrity of insulation at corners, wall to ceiling joint, roof, and floor. Avoid creating thermal bridges and voids. Provide and verify continuity of insulative barrier throughout the building enclosure.

3.3.5 Coordination

Verify final installed insulation thicknesses comply with thicknesses indicated, R-values specified herein, and with the approved insulation submittal(s).

3.4 INSTALLATION ON WALLS

3.4.1 Installation using Furring Strips

Install insulation between members as recommended by insulation manufacturer.

3.4.2 Installation on Masonry Walls

Apply board directly to masonry with adhesive or fasteners as recommended by the insulation manufacturer. Fit between obstructions without impaling board on ties or anchors. Apply in parallel courses with joints breaking midway over course below. Place boards in moderate contact with adjoining insulation without forcing and without gaps. Cut and shape as required to fit around wall penetrations, projections or openings to accommodate conduit or other utilities. Seal around cutouts with sealant. Install insulation in wall cavities so that it leaves at least a nominal 1 inch air space outside of the insulation to allow for cavity drainage.

3.4.3 Adhesive Attachment to Concrete and Masonry Walls

Apply adhesive to wall and completely cover wall with insulation.

c. As recommended by the insulation manufacturer.

d. Use only full back method for pieces of 1 square foot or less.

e. Butt all edges of insulation and seal edges with tape.

3.4.4 Mechanical Attachment on Concrete and Masonry Walls

Cut insulation to cover walls. Apply adhesive to wall and set clip or other mechanical fastener in adhesive as recommended by manufacturer. After curing of adhesive, install insulation over fasteners and bend split prongs to provide a flush condition with the insulation. Butt all edges of insulation and seal with tape.

3.4.5 Protection Board or Coating

Install protection board or coating in accordance with manufacturer's printed instructions. Install protection over all exterior exposed insulation and to 1 foot below grade.

3.5 PERIMETER AND UNDER SLAB INSULATION

Install perimeter thermal insulation where heated spaces are adjacent to exterior walls, slab edges in slab-on-grade, or floating slab construction.

3.5.1 Manufacturer's Instructions

Layout insulation, tape edges, provide vapor retarder and other required accessories to protection against vermin, insects, and damage in

accordance with manufacturer's printed instructions.

3.5.2 Insulation on Vertical Surfaces

Provide thermal insulation on exterior of foundation walls on grade beamsand on edges of slabs-on-grade. Fasten insulation with adhesive.

3.5.3 Insulation Under Slab

Provide insulation horizontally under slab on grade for a distance of 2 feet from the edge of slab.

3.5.4 Protection of Insulation

Protect insulation from damage during construction and back filling by application of protection board or a coating. Do not leave installed vertical insulation unprotected overnight. Protect installed insulation from weather, including rain and ultraviolet light, from mechanical abuse, compression, and dislocation.

3.6 VAPOR RETARDER

Apply vapor retarder continuous across all surfaces. Overlap all joints at least 6 inches and seal with pressure sensitive tape. Seal at sills, header, windows, doors and utility penetrations. Repair punctures or tears with pressure sensitive tape.

SECTION 07 27 10.00 10

BUILDING AIR BARRIER SYSTEM
**05/14 OmahaInsp**

PART 1 GENERAL

1.1 SUMMARY

This Section specifies the construction and quality control of the installation of an air barrier system. Construct the air barrier system indicated, taking responsibility for the means, methods, and workmanship of the installation of the air barrier system. The air barrier must be contiguous and connected across all surfaces of the enclosed air barrier envelope indicated. The maximum leakage requirements of individual air barrier components and materials are specified in the other specification sections covering these items.

1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referenced within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

| | |
|---|---|
| ASTM D4541 | (2009; E 2010) Pull-Off Strength of Coatings Using Portable Adhesion Testers |

U.S. DEPARTMENT OF DEFENSE (DOD)

| | |
|---|---|
| UFC 3-101-01 | (2020; with Change 1, 2021) Architecture |

1.3 DEFINITIONS

The following terms as they apply to this section:

1.3.1 Air Barrier Accessory

Products designated to maintain air tightness between air barrier materials, air barrier assemblies and air barrier components, to fasten them to the structure of the building, or both (e.g., sealants, tapes, backer rods, transition membranes, fasteners, strapping, primers).

1.3.2 Air Barrier Assembly

The combination of air barrier materials and air barrier accessories that are designated and designed within the environmental separator to act as a continuous barrier to the movement of air through the environmental separator.

1.3.3 Air Barrier Component

Pre-manufactured elements such as windows, doors, dampers and service elements that are installed in the environmental separator.

1.3.4 Air Barrier Envelope

The combination of air barrier assemblies and air barrier components, connected by air barrier accessories that are designed to provide a continuous barrier to the movement of air through an environmental separator. There may be more than one air barrier envelope in a single building. Also known as Air Barrier System.

1.3.5 Air Barrier Material

A building material that is designed and constructed to provide the primary resistance to airflow through an air barrier assembly.

1.3.6 Air Barrier System

Same as AIR BARRIER ENVELOPE.

1.3.7 Air Leakage Rate

The rate of airflow (CFM) driven through a unit surface area (sq.ft.) of an assembly or system by a unit static pressure difference (Pa) across the assembly. (example: 0.25 CFM/sq.ft. @ 75 Pa)

1.3.8 Air Leakage

The total airflow (CFM) driven through the air barrier system by a unit static pressure difference (Pa) across the air barrier envelope. (example: 6500 CFM @ 75 Pa)

1.3.9 Air Permeance

The rate of airflow (CFM) through a unit area (sq.ft.) of a material driven by unit static pressure difference (Pa) across the material (example: 0.004 CFM/sq.ft. @ 75 Pa).

1.3.10 Environmental Separator

The parts of a building that separate the controlled interior environment from the uncontrolled exterior environment, or that separate spaces within a building that have dissimilar environments. Also known as the Control Layer.

1.4 PREPARATORY PHASE OR PRECONSTRUCTION CONFERENCE

Organize pre-construction conferences between the air barrier inspector and the sub-contractors involved in the construction of or penetration of the air barrier system to discuss where the work of each sub-contractor begins and ends, the sequence of installation, and each sub-contractor's responsibility to ensure airtight joints, junctures, penetrations and transitions between materials. Discuss the products, and assemblies of products specified in the different sections to be installed by the different sub-contractors.

1.5 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for

inclusion in the Sustainability Notebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-07 Certificates

Air Barrier Inspector; G, RO

Two copies 30 days after Notice to Proceed.

1.6 AIR BARRIER INSPECTOR

Employ a designated Air Barrier Inspector on this project. The Air Barrier Inspector performs a Construction Review, inspection, and coordination, oversees quality control testing specified in these specifications, performs quality control air barrier inspection as specified, interfaces with the designer and product manufacturer's representatives to assure all installation requirements are met, and coordinates efforts between all workers installing or penetrating the air barrier materials. Qualification for the Air Barrier Inspector are as follows:

a. Training and certification as an Air Barrier Installer from the Air Barrier Association of America (ABAA) or other third party air barrier association.

b. Experience coordinating and instructing personnel involved in the installation, joining, and sealing of air barrier materials and components.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.1 QUALITY CONTROL

3.1.1 Documentation and Reporting

Document the entire installation process on daily job site reports. These reports include information on the Installer, substrates, substrate preparation, products used, ambient and substrate temperature, the location of the air barrier installation, the results of the quality control procedures, and testing results.

3.1.2 Quality Control Inspection

Conduct the following tests and inspections as applicable in the presence of the Contracting Officer during installation of the air barrier system, and submit quality control reports as indicated below.

a. Provide a Daily Report of Observations with a copy to the Contracting Officer.

b. Inspect to assure continuity of the air barrier system throughout the building enclosure and that all gaps are covered, the covering is structurally sound, and all penetrations are sealed allowing for no infiltration or exfiltration through the air barrier system.

c. Inspect to assure structural support of the air barrier system to withstand design air pressures.

d. Inspect to assure masonry surfaces receiving air barrier materials are smooth, clean, and free of cavities, protrusions and mortar droppings, with mortar joints struck flush or as required by the manufacturer of the air barrier material.

e. Inspect and test to assure site conditions for application temperature, and dryness of substrates are within guidelines.

f. Inspect to assure substrate surfaces are properly primed if applicable and in accordance with manufacturer's instructions. Priming must extend at least 2 inches beyond the air barrier material to make it obvious that the primer was applied to the substrate before the air barrier material.

g. Inspect to assure laps in materials are at least a 2-inch minimum, shingled in the correct direction or mastic applied in accordance with manufacturer's recommendations, and with no fishmouths.

h. Inspect to assure that a roller has been used to enhance adhesion. Identify any defects such as fishmouths, wrinkles, areas of lost adhesion, and improper curing. Note the intended remedy for the deficiencies.

i. Measure application thickness of liquid applied materials to assure that manufacturer's specifications for the specific substrate are met.

j. Inspect to assure that the correct materials are installed for compatibility.

k. Inspect to assure proper transitions for change in direction and structural support at gaps.

l. Inspect to assure proper connection between assemblies (membrane and sealants) for cleaning, preparation and priming of surfaces, structural support, integrity and continuity of seal.

m. Perform adhesion tests for fluid-applied and self-adhered air barrier membranes to assure that the manufacturer's specified adhesion strength properties are met. Determine the bond strength of coatings to substrate in accordance with ASTM D4541.

n. Provide cohesion tests for spray polyurethane foam (SPF).

o. Provide written test reports of all tests performed.

## 3.2 REPAIR AND PROTECTION

Upon completion of inspection, testing, sample removal and similar services, repair damaged construction and restore substrates, coatings and finishes. Protect construction exposed by or for quality control service activities, and protect repaired construction.

## 3.3 PROJECT AIR BARRIER SCOPE

This project air barrier requirements include full installation and visual

testing/inspection and coordination, but does not include the blower door test due to project size and facility type. Project shall still be constructed as if it would be blower door tested for the 0.25 CFM/ft2 Allowable Air Leakage Rate mandated for Army projects per UFC 3-101-01. The air barrier perimeter on this project includes all roof(deck and deckless areas)assemblies and exterior wall assemblies with pre-insulated metal wall panels. The wall separating the high bay Apparatus Bay from the Administration area shall also be considered an air barrier wall assembly from finished floor to roof assembly. All exterior wall assemblies, doors, windows, and penetrations shall be considered part of the air barrier envelope. The air barrier at the exterior wall and roof juncture shall extend continuously without gaps in coverage and continuity. Air barrier specific materials shall include use of fluid applied materials, peel and stick rolls, fabric sheets, adhesives, foam rolls, sealants, and spray foams. Tape type materials are not recommended unless specifically made for Vapor or Air Barrier assemblies. Materials shall be compatible with each other for the life of the facility. The high bay separation wall air barrier includes the painted GWB and the perimeter seal. This interior wall's doors are also part of that air barrier. All penetrations through air barriers shall be sealed with appropriate foams and sealant. See drawings for locations of air barrier materials and intended material type. Interior walls separating Electrical Room 19 and Mechanical Room 20 from the rest of the building are also considered air barrier separation walls.

## 1.2 RELATED REQUIREMENTS

Coordinate the requirements of Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM, and other building enclosure sections to provide a complete building air barrier system. Submit all materials, components, and assemblies of the air barrier system together as one complete submittal package.

## 1.3 SUBMITTALS

Government approval is required for submittals with a "G" classification. Submittals not having a "G" classification are for information only. When used, a code following the "G" classification identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualifications of Manufacturer; G, RO

Qualifications of Installer; G, RO

SD-02 Shop Drawings

Self-adhering Air Barrier; G, DO

SD-03 Product Data

Self-adhering Air Barrier; G, DO

Primers, Adhesives, and Mastics; G, RO

Safety Data Sheets; G, RO

SD-04 Samples

Self-adhering Air Barrier Mockup; G, RO

SD-06 Test Reports

Field Peel Adhesion Test; G, RO

Flame Propagation of Wall Assemblies; G, DO

Flame Spread and Smoke Developed Index Ratings; G, DO

Site Inspections and Testing; G, RO

SD-07 Certificates

Self-adhering Air Barrier; G, RO

SD-08 Manufacturer's Instructions

Self-adhering Air Barrier; G, RO

Primers, Adhesives, and Mastics; G, RO

## 1.4 MISCELLANEOUS REQUIREMENTS

For self-adhering air barrier provide the following:

### 1.4.1 Shop Drawings

Submit self-adhering air barrier shop drawings showing locations and extent of air barrier assemblies and details of all typical conditions, intersections with other building enclosure assemblies and materials, and membrane counterflashings. Show details for bridging of gaps in construction, treatment of inside and outside corners, expansion joints, methods of attachment of materials covering the self-adhered barrier without compromising the barrier. Indicate how miscellaneous penetrations such as conduit, pipes, electric boxes, brick ties, and similar items will be sealed.

### 1.4.2 Product Data

Submit manufacturer's technical data indicating compliance with performance and environmental requirements, manufacturer's printed instructions for evaluating, preparing, and treating substrates, temperature and other limitations of installation conditions, safety requirements for installation, and Safety Data Sheets. Indicate flame and smoke spread ratings for all products.

### 1.4.3 Mockup

Provide a mockup of the self-adhering air barrier system specified. Apply product in an area designated by the Contracting Officer. Apply an area of not less than 54 square feet. Include all components specified as

representative of the complete system. Notify the Contracting Officer a minimum of 48 hours prior to the test application. Select a test area representative of conditions to be covered including window or door openings, wall to ceiling transitions, flashings, and penetrations, as applicable.

### 1.4.4 Test Reports

Submit test reports indicating that field peel-adhesion tests on all materials have been performed and the changes made, if required, in order to achieve successful and lasting adhesion. Submit test reports for flame propagation of wall assemblies tested in accordance with NFPA 285. Submit test reports for flame spread and smoke developed index ratings of barrier system materials tested in accordance with ASTM E84.

## 1.5 DELIVERY, STORAGE, AND HANDLING

### 1.5.1 Delivery

Deliver and store materials in sufficient quantity to allow for uninterrupted flow of work. Inspect materials delivered to the site for damage and store out of weather. Deliver materials to the jobsite in their original unopened packages, clearly marked with the manufacturer's name, brand designation, description of contents, and shelf life of containerized materials. Store and handle to protect from damage.

### 1.5.2 Storage

Inspect materials delivered to the site for damage; unload and store out of weather in manufacturer's original packaging. Store only in dry locations, not subject to open flames or sparks, and easily accessible for inspection and handling. Protect stored materials from direct sunlight. Keep materials sealed and separated from absorptive materials, such as wood and insulation.

## 1.6 FIELD PEEL ADHESION TEST

Perform a field peel-adhesion test on the construction mockup. Test the self-adhering air barrier for adhesion in accordance with ASTM D4541 using a Type II pull tester except use a disk that is 4 inches in diameter and cut through the membrane to separate the material attached to the dish from the surrounding material. Perform test after curing period in accordance with manufacturer's written recommendations. Record mode of failure and area which failed in accordance with ASTM D4541. Compare adhesion values with the manufacturer's established minimum values for the particular combination of material and substrate. Indicate on the inspection report whether the manufacturer's requirement has been met. Where the manufacturer has not declared a minimum adhesion value for their product and substrate combination, the inspector must record actual values.

## 1.7 AIR BARRIER TESTING

Perform air barrier testing in accordance with Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM.

## 1.8 QUALITY ASSURANCE

### 1.8.1 Qualifications of Manufacturer

Submit documentation verifying that the manufacturer of the self-adhering air barrier is currently accredited by Air Barrier Association of America ( ABAA Accreditation https://www.airbarrier.org/).

### 1.8.2 Qualifications of Installer

Submit documentation verifying that installers of the self-adhering air barrier are currently certified in accordance with the ABAA QAP Quality Assurance Program (https://www.airbarrier.org/qap/).

## 1.9 PRECONSTRUCTION MEETING

Conduct a preconstruction meeting a minimum of two weeks prior to commencing work specified in this Section. Agenda must include, at a minimum, construction and testing of mockup, sequence of construction, coordination with substrate preparation, materials approved for use, compatibility of materials, coordination with installation of adjacent and covering materials, and details of construction. Attendance is required by representatives of related trades including covering materials, substrate materials, adjacent materials, and materials and components of the air barrier system.

## 1.10 ENVIRONMENTAL CONDITIONS

### 1.10.1 Temperature

Install air barrier within the range of ambient and substrate temperatures as recommended in writing by the air barrier manufacturer. Verify that the surface to receive self-adhering air barrier is dry for a minimum of 48 hours prior to the installation of the barrier. Do not apply air barrier to damp or wet substrates. Do not apply during inclement weather or when ice, frost, surface moisture, or visible dampness is present on surfaces to be covered, or when precipitation is imminent.

### 1.10.2 Exposure to Weather and Ultraviolet Light

Protect air barrier products from direct exposure to rain, snow, sunlight, mist, and other extreme weather conditions. Replace, at no additional cost to the government, barrier products that have been exposed to ultraviolet (sun)light longer than allowed by manufacturer's written requirements.

# PART 2 PRODUCTS

## 2.1 SELF ADHERING AIR BARRIER

Provide minimum 0.040 inch thick self-adhering, vapor retarding, air barrier membrane consisting of a cross-laminated high density polyethylene (HDPE) film, fully coated with rubberized asphalt adhesive. Provide membrane in rolls of various widths interleaved with disposable silicone release paper. Self-adhering air barrier must exhibit no visible water leakage when tested in accordance with ASTM E331 and must perform as a liquid water drainage plane flashed to discharge to the exterior any incidental condensation or water penetration. Use regular or low temperature formulation depending on site conditions, within temperature

ranges specified by manufacturer.

2.1.1 Physical Properties

a. Air Permeance (ASTM E2178): Less than 0.004 CFM per sf at 1.57 psf.

b. Air Leakage (ASTM E2357, ASTM E283): less than 0.004 CFM per sf at 1.57 psf at one inch.

c. Tensile Strength (ASTM D412 die C modified): Not less than 400 psi.

d. Tensile Elongation (ASTM D412 die C modified): Not less than 200 percent.

e. Puncture Resistance (ASTM E154/E154M): Not less than 40 lbs.

f. Pliability (ASTM D146/D146M): Unaffected at minus 25 degrees F, 0.063 inch mandrel.

g. Lap Adhesion (ASTM D1876 modified): Not less than 4.0 lbs per inch.

h. Peel Adhesion (ASTM D903): Not less than 5.0 lbs per inch.

i. Water Vapor Permeance (Vapor Impermeable Air Barrier) (ASTM E96/E96M, desiccant method A): 0.1 perms or less.

j. Water Absorption (ASTM D570): Not to exceed 0.12 percent by weight.

k. Flame propagation of wall assemblies (NFPA 285): Pass

l. Surface Burning Characteristics (ASTM E84):

(1) Flame Spread Index Rating not higher than 75.

(2) Smoke Developed Index Rating not higher than 150.

2.2 PRIMERS, ADHESIVES, AND MASTICS

Provide primers, adhesives, mastics and other accessory materials as recommended in writing by the manufacturer of the self-adhering air barrier for adequate bonding to each type of substrate.

2.3 SHEET METAL FLASHING

Provide as specified in Section 07 60 00 FLASHING AND SHEET METAL.

2.4 JOINT SEALANTS

Provide as specified in Section 07 92 00 JOINT SEALANTS. Verify compatibility with adjacent products that are or will be in contact with one another.

PART 3 EXECUTION

3.1 EXAMINATION

Before installing air barrier, examine substrates, areas, and conditions under which air barrier assemblies will be applied, with Installer present, for compliance with requirements. Ensure the following conditions

are met:

a. Surfaces are sound, dry, even, and free of oil, grease, dirt, excess mortar or other contaminants.

b. Concrete surfaces are cured and dry, smooth without large voids, spalled areas or sharp protrusions.

c. Verify substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method in accordance with ASTM D4263 and take suitable measures until substrate passes moisture test.

d. Verify sealants used in sheathing are compatible with membrane proposed for use. Perform field peel adhesion test on materials to which sealants are adhered.

## 3.2 PREPARATION

Clean, prepare, and treat substrate in accordance with manufacturer's written instructions. Ensure clean, dust-free, and dry substrate for air barrier application.

a. Prime masonry and concrete substrates with conditioning primer.

b. Prime gypsum sheathing an adequate number of coats to achieve required bond, with adequate drying time between coats.

c. Prime wood, metal, and painted substrates with primer.

d. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through air barrier and at protrusions.

## 3.3 INSTALLATION

### 3.3.1 Installation of Self-adhering Air Barrier

Install materials in accordance with manufacturer's recommendations and the following:

a. Apply primer at rate recommended by manufacturer prior to membrane installation. Allow primer to dry completely before membrane application. Apply as many coats as necessary for proper adhesion.

b. When membrane is properly positioned, press into place and roll membrane with roller immediately after placement.

c. Apply membrane sheets to shed water naturally without interception by a sheet edge, unless that edge is sealed with permanently flexible termination mastic.

d. Position subsequent sheets of membrane applied above so that membrane overlaps the membrane sheet below by a minimum of 2-1/2 inches, unless greater overlap is recommended by manufacturer. Roll into place with roller.

e. Make all side laps a minimum of 2-1/2 inches and all end laps a minimum of 5 inches, unless greater overlap is recommended by manufacturer. Roll seams with roller.

f. Roll membrane to adhere to substrate. Cover corners and joints with two layers of reinforcement by first applying a 12 inch width of membrane centered along the axis. Flash drains and projections with a second ply of membrane for a distance of 6 inches from the drain or projection.

g. Seal around all penetrations through the air barrier resulting from pipes, vents, conduit, electrical fixtures, structural members, or other construction passing through it. Seal with termination mastic, extruded silicone sealant, membrane counterflashing or other sealing methods in accordance with manufacturer's written recommendations.

h. Continuously connect the air barrier between walls, roof, floor and below grade assemblies to form a continuous integrated air barrier system around the entire building enclosure. Extend the air barrier membrane into rough openings such as doors, windows, louvers, and other exterior penetrations. Seal edges of barrier at junctures with rough openings.

i. At changes in substrate plane, provide transition material (e.g. bead of sealant, mastic, extruded silicone sealant, membrane counterflashing or other material recommended by manufacturer) under membrane to eliminate all sharp 90 degree inside corners and to make a smooth transition from one plane to another.

j. Provide mechanically fastened non-corrosive metal sheet to span gaps in substrate plane and to make a smooth transition from one plane to the other. Continuously support membrane with substrate.

k. At deflection and control joints, provide backup for the membrane to accommodate anticipated movement.

l. At expansion and seismic joints provide transition to the joint assemblies.

m. Apply a bead or trowel coat of mastic along membrane seams at reverse lapped seams, rough cuts, and as recommended by the manufacturer.

n. At end of each working day, seal top edge of membrane to substrate with termination mastic.

o. Do not allow materials to come in contact with chemically incompatible materials.

p. Counterflash upper edge of thru-wall flashing and air barrier. Counter flashing and thru-wall flashing are specified in Section 07 60 00 FLASHING AND SHEET METAL.

## 3.4 FIELD QUALITY CONTROL

### 3.4.1 Site Inspections and Testing

Provide site inspections and testing in accordance with ABAA protocol to verify conformance with the manufacturer's instructions, the ABAA QAP Quality Assurance Program (https://www.airbarrier.org/qap/), Section 07 27 10.00 10 BUILDING AIR BARRIER SYSTEM, and this section.

a. Conduct inspections and testing at 5, 50, and 95 percent completion of

this scope of work. Forward written site inspections and testing reports to the Contracting Officer within five working days of the inspection and test being performed.

b. If inspections reveal any defects, promptly remove and replace defective work at no additional expense to the Government.

## 3.5 FIELD PEEL ADHESION TEST

Conduct in accordance with test protocol indicated in Part 1, paragraph FIELD PEEL ADHESION TEST.

## 3.6 PROTECTION AND CLEANING

### 3.6.1 Protection

#### 3.6.1.1 Adjacent Surfaces

Protect exposed adjacent surfaces that could be damaged by primers and adhesives associated with air barrier membrane. Provide protection during application and the remainder of construction in accordance with manufacturer's written instructions.

#### 3.6.1.2 The Air Barrier Assembly

Protect finished portions of the air barrier assembly from damage during ongoing application and throughout the remainder of the construction period in accordance with manufacturer's written instructions. Coordinate timing of installation of materials that will cover the air barrier membrane to ensure the exposure period does not exceed that recommended by the air barrier manufacturer's written installation instructions. Remove and replace, at no additional cost to the government, membrane products that exceed the manufacturer's allowed exposure limits.

### 3.6.2 Cleaning

Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction and as acceptable to the primary material manufacturer.

SECTION 07 27 36

SPRAY FOAM INSULATION
**07/19OMAHA**

PART 1 GENERAL

1.1 BUILDING AIR BARRIER TESTING

This building is required to pass a building air barrier test. Spray polyurethane foam (SPF) will serve as a critical component of the building envelope in helping to minimize or eliminate air infiltration through building cracks, joints, wall assemblies and components of construction. See the design drawings and 07 27 10.10 10 BUILDING AIR BARRIER SYSTEM for more information on extent and type of testing required.

Other specifications in this project may allow the use of spray polyurethane foam in limited applications. All SPF used on this project shall conform to the requirements specified herein.

## 1.3 SUSTAINABILITY REQUIREMENTS

Materials in this technical specification may contribute towards contract compliance with sustainability requirements. See Section 01 33 29 LEED DOCUMENTATION for project requirements.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. The following shall be submitted in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Closed-Cell Spray Polyurethane Foam; G, DO

Submit manufacturer's product data indicating conformance with specified physical and performance properties. Provide product data for each type of spray foam to be used and where it is intended to be used. Provide UL listing for products in fire rated walls.

Thermal Barrier; G, DO

Provide product data for each type of thermal barrier to be used and where it is intended to be used. Provide documentation that it is compatible with the spray foam to which it is being applied and that the assembly complies with the criteria identified below.

Manufacturer Letter

Submit letter from primary materials manufacturer indicating approval of products (such as thermal barrier) not manufactured by primary manufacturer.

SD-07 Certificates

Qualification of Applicator; G, PO

Provide certificates for each product being installed on the project.

SD-08 Manufacturer's Instructions

Manufacturer's Installation Instructions.

Information shall include manufacturer's printed instructions for evaluating, preparing, and treating substrate, temperature and other limitations of installation conditions.

## 1.5 QUALITY ASSURANCE

The SPF system applicator shall have prior manufacturer training in the application of sprayed polyurethane foam and coating materials. Applicator shall be certified and approved by the foam manufacturer to apply the specified materials and provide the specified manufacturer warranty. Applicator shall have a minimum of 2 years experience in application of the specified materials. The applicator shall supply the names, locations and client contact information of 5 projects of similar size and scope that the applicator has constructed using the manufacturer's products submitted for this project within the previous two years.

## 1.6 SUMMARY

Provide spray polyurethane foam system(s) that perform to the technical requirements identified herein. These systems are intended to be used in steel stud wall cavities, building joints and penetrations in critical building assemblies to serve as an insulator, sound barrier and air barrier. Open-cell spray polyurethane foam as described below shall be used in steel stud wall cavities and any areas of extensive application. Closed-cell foam shall only be used to fill cracks, joints and penetrations where application of open-cell foam at the required thickness is not practical or will not meet the performance requirements identified

below. All spray polyurethane foam provided in this project shall be covered with an approved 15 minute thermal barrier per NFPA 101, NFPA 90A, NFPA 286 and NFPA 275.

1.6.1 Connections to Adjacent Materials

Provide spray polyurethane foam products to prevent air leakage at the following locations:

1. Foundation and walls, including penetrations, ties and anchors.
2. Walls, windows, curtain walls, storefronts, louvers or doors.
3. Different wall assemblies, and fixed openings within those assemblies.
4. Wall and roof connections.
5. Floors over unconditioned space.
6. Walls, floor and roof across construction, control and expansion joints.
7. Walls, floors and roof to utility, pipe and duct penetrations.
8. Seismic and expansion joints.
9. All other leakage pathways in the building envelope.

1.7 DELIVERY, STORAGE, AND HANDLING

Deliver materials to site in manufacturer's original, unopened containers and packaging, with labels clearly identifying product name and manufacturer.

Store materials in a clean dry area in accordance with manufacturer's instructions.

Store at temperatures at or above 40oF, free from contact with cold or frozen surfaces.

Protect materials during handling and application to prevent damage or contamination.

1.8 ENVIRONMENTAL REQUIREMENTS

Product not intended for uses subject to abuse or permanent exposure to the elements.

Do not apply when air or surface temperatures are below 40 degrees F.

Do not apply when air, material and surface temperatures are expected to fall below 32° F within 24 hours of completed application.

PART 2 PRODUCTS

2.1 CLOSED-CELL SPRAY POLYURETHANE FOAM INSULATION

Provide materials which have an air permeance not to exceed 0.004 cubic feet per minute per square foot under a pressure differential of 0.3 in. water (1.57 psf) (0.02 L/sm @ 75 Pa.) when tested according to ASTM E2178.

Material shall meet requirements of CAN/ULC S705.1, Standard for Thermal Insulation - Spray Applied Rigid Polyurethane Foam, Medium Density - Material - Specification. CCMC Evaluation Report or reports from accredited testing laboratory shall be made available upon request. Materials shall meet or exceed the following performance requirements as

indicated in the test reports.

a. Core Density: 1.9-2.3 pcf when tested in accordance with ASTM D1622.
b. Thermal Resistance: Minimum R-value of 6.0 per inch when tested in accordance with ASTM C518 and/or ASTM C177.
c. Closed Cell Content: Greater than 90 percent when tested in accordance with ASTM D2842.
d. Water Absorption: Less than 1 percent by volume when tested in accordance with ASTM D2842.
e. Dimensional Stability: Less than 4.9 percent by volume when tested in accordance with ASTM D2126 at 75 degrees F/95 percent RH, 28 Days.
f. Water Vapor Transmission: 1.39 perm/inch or greater when tested in accordance with ASTM E96/E96M.
g. Air Permeability: 0.004 CFM/SF (0.02 L/s/m2) or less when tested in accordance with ASTM E283 at 75 Pa at 3-1/2 inch thickness.
h. Fungi Resistance: Pass, with no growth when tested in accordance with ASTM C1330.
i. Fire Performance: Flame Spread less than 25 and smoke less than 450 when tested in accordance with ASTM E84.

2.2 Fire Rated Walls

Fire resistance ratings shall be in accordance with the fire rated assemblies listed in UL Fire Resistance Directory. Proposed materials not listed in UL Fire Resistance Directory shall have fire resistance ratings at least equal to the UL Fire Resistance ratings as determined by an approved independent testing laboratory, based on tests specified in UL 263 or ASTM E119.

2.3 Spray Foam for Roof

Spray foam for roof insulation gaps shall be compatible with roof insulation manufacturer and and roof membrane manufacturer.

2.4 Spray Foam for Door Frames

Provide type of spray foam as recommended by the door frame manufacturer.

2.5 THERMAL BARRIER

Provide NFPA 275 compliant thermal barriers compatible and tested with the spray polyurethane products installed on the project. Where spray foam is fully encapsulated by 1/2" or more gypsum wall board, the gypsum wall board qualifies as an approved 15 minute thermal barrier. Areas of spray polyurethane foam not fully encapsulated by gypsum wall board shall receive a spray-applied intumescent paint based fire protective coating specifically formulated for application over sprayed polyurethane foam plastics (SPF) with a nominal density of 0.5 pounds per cubic foot (pcf). Thermal barrier and foam system shall be tested and installed compliant with the following criteria:

1. NFPA 101
2. NFPA 90A
3. NFPA 286
4. NFPA 275
5. ASTM E84

The insulation/thermal barrier assembly shall have the following

characteristics when installed in the following locations:

When installed in walls, ceilings and areas fully enclosed and protected by 1/2" minimum gypsum wall board: Flame Spread Index less than 25 and Smoke Developed Index less than 450 when tested in accordance with ASTM E84.

When installed in spaces that serve as a return air plenum (such as areas above a finished ceiling, but below the structural roof or deck): Flame Spread Index less than 25 and Smoke Developed Index less than 50 when tested in accordance with ASTM E84.

When installed in all other conditions in the project: Flame Spread Index less than 25 and Smoke Developed Index less than 50 when tested in accordance with ASTM E84.

## PART 3 EXECUTION

### 3.1 EXAMINATION

Verify that surfaces and conditions are suitable prior to commencing work of this section. Ensure that surfaces are sound, dry, even, and free of oil, grease, dirt, excess mortar or other contaminants. Do not proceed with installation until unsatisfactory conditions have been corrected.

### 3.2 SURFACE PREPARATION

Clean, prepare, and treat substrate according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate.

Protection from Spray Applied Materials:

1. Mask and cover adjacent areas to protect from over spray.
2. Ensure any required foam stop or back up material are in place to prevent over spray and achieve complete seal.
3. Seal off existing ventilation equipment. Install temporary ducting and fans as required to exhaust fumes. Provide for make-up air.
4. Erect barriers, isolate area and post warning signs to advise non-protected personnel to avoid the spray area.

### 3.3 INSTALLATION

#### 3.3.1 Spray Application of Polyurethane

Install materials in accordance with manufacturer's recommendations. Apply in minimum thickness identified in the design drawings and details. To serve as an effective air barrier, open-cell spray polyurethane foam shall be applied in a minimum total thickness of 3 inches. Closed-cell spray polyurethane foam shall be applied in a minimum total thickness of 1 inch.

#### 3.3.2 Spray Applied Thermal Barrier Installation

Apply thermal barrier to spray polyurethane foam in the locations indicated in this specification per manufacturer instructions.

1.2 DEFINITIONS

Fabricated Roof Panel Assembly: Metal roof and liner panels, attachment system components, miscellaneous metal framing, thermal insulation, and accessories shop-fabricated or field-assembled for a complete weathertight roofing system.

1.3 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualification of Manufacturer; G, DO

Qualification of Installer; G, DO

On-Site Inspection and Acceptance Procedure; G, RO

SD-02 Shop Drawings

Roofing Panels; G, DO

Flashing and Accessories; G, DO

SD-03 Product Data

Factory Color Finish; G, DO

Sub-girts and Formed Shapes;

Closure Materials; G, DO

Insulation; G, DO

Accessories; G, DO

SD-04 Samples

Roofing Panels; G, DO

Manufacturer's Color Charts and Chips; G, DO

SD-05 Design Data

Wind Design Analysis; G, DO

SD-06 Test Reports

Leakage Tests; G, DO

Factory Finish and Color Performance Requirements; G, DO

SD-08 Manufacturer's Instructions

Installation of Roof Panel Assemblies

SD-11 Closeout Submittals

Warranty

1.4 QUALITY CONTROL

1.4.1 Preroofing Conference

After submittals are received and approved but before roofing and insulation work, including associated work, is performed, the Contracting Officer will hold a preroofing conference to review the following:

a. The drawings and specifications:

(1) Fabrication and installation drawings for the following items are to indicate completely dimensioned structural frame and erection layouts, openings in the roof, special framing details and construction details at corners, ridges, eaves, building intersections, curbs and flashing, location and type of mastic and metal filler strips, location and erection of flashing and gutter/downspout assembly.

(2) Installation of roof panel assemblies

(3) Roofing panels, submit sample 12 inches long

(4) Flashing and accessories

Submit the manufacturer's color charts and chips, approximately 4 by 4 inches, showing the full range of colors, textures and patterns available for roof panels with the factory color finish.

Submit factory finish and color performance requirements verified by an independent testing agency.

Submit a wind design analysis from the manufacturer showing compliance of the roof panels and anchorage system with the indicated required design wind uplift pressure diagrams for the attachment configuration and design to be used. Include a roof plan delineating dimensions and attachment patterns for each zone. The wind design analysis shall be signed, dated and sealed by the licensed structural engineer, or licensed professional engineer with the specified time of experience in structural engineering, responsible for the design of the roof panel system and its attachment to the structure.

b. Qualifications including:

(1) Qualification of Manufacturer

(2) Qualification of Installer

c. Submit a work plan for coordination of the various trades involved in providing the roofing system and other components secured to the roofing.

Include detailed application instructions and standard manufacturer drawings altered as required by these specifications. Explicitly identify in writing the differences between the manufacturer's instructions and the specified requirements.

e. Safety requirements

f. Submit manufacturer's data indicating the percentage of recycle material in roofing panels to verify sustainable acquisition compliance.

1.4.2 Manufacturer's Technical Representative

Ensure the representative has authorization from the manufacturer to approve field changes and is thoroughly familiar with the products and installations in the geographical area where construction will take place.

1.4.3 Qualification of Manufacturer

Guarantee the metal roof panel system manufacturer possesses the following:

a. A minimum of five years of experience in manufacturing metal roof system and accessory products.

b. Engineering services of a structural engineer; currently licensed in the geographical area where construction will take place, and having a minimum of four years of experience in practice as a structural engineer, knowledgeable in roof wind design analysis, protocols and procedures for the MBMA RSDM; ASCE 7, UL 580 and FM 4474 FM wind design guide for metal roof systems.

c. Certified engineering calculations, sealed by a structural engineer having the same qualifications stated above, applicable to the products submitted for wind uplift requirements in accordance with FM 4474 and ASCE 7.

1.4.4 Qualification of Installation Contractor

Confirm that the installation contractor is approved and certified by the roofing panel manufacturer before installing the metal roofing system.

1.4.5 Qualifications for Welding

Provide certification of welding procedures conforming to AWS A5.1/A5.1M and AWS D1.1/D1.1M

1.4.6 Single-Source

Obtain each type of metal roof and liner panels, clips, closures and other accessories from the standard products of the single-source manufacturer to ensure these items operate as a complete system for the intended use.

## 1.5 DELIVERY, STORAGE, AND HANDLING

Deliver components, sheets, metal roof panels, and other manufactured items, handling them in a manner to prevent damage or deformation; package metal roof panels for protection during transportation and handling.

Unload, store, and erect metal roof panels in a manner to prevent bending, warping, twisting, and surface damage.

Stack metal roof panels on platforms or pallets, covered with a suitable weather-tight and ventilated covering; store metal roof panels to ensure dryness. Do not store metal roof panels in contact with other materials that might cause staining, denting, or other surface damage.

Protect the strippable protective covering on metal roof panels from exposure to sunlight and high humidity, except to extent necessary for the period of metal roof panel installation.

Protect foam-plastic insulation as follows:

a. Do not expose the foam-plastic insulation to sunlight, except to extent necessary for period of installation and concealment.

b. Protect the foam-plastic insulation against ignition at all times. Do not deliver foam-plastic insulation materials to the project site before installation time.

Complete installation and concealment of plastic materials as rapidly as possible.

## 1.6 PROJECT/SITE CONDITIONS

Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit metal roof panel work to be performed according to the manufacturer's written instructions and warranty requirements.

Field Measurements: Verify th actual dimensions of construction contiguous with metal roof panels by field measurements before fabrication.

## 1.7 WARRANTY

Furnish the metal roof panel manufacturer's 20-year roof system materials and installation workmanship warranty, including flashing, insulation, components, trim, and accessories necessary for a watertight roof system construction. Issue the warranty directly to the Government, such that the warranty takes effect at the time of the Government's acceptance of the roof work. Provide a warranty with the following conditions:

a. If within the warranty period, the metal roof system, as installed for its intended use in the normal climatic and environmental conditions of the facility, becomes nonwater-tight, shows evidence of moisture intrusion within the assembly, displaces, corrodes, perforates, separates at the seams, or shows evidence of excessive weathering due to defective materials or installation workmanship, the repair or replacement of the defective and damaged materials of the metal roof system and correction of defective workmanship is the responsibility of the metal roof panel manufacturer. All costs associated with the repair or replacement work are the responsibility of the metal roof

panel manufacturer. Conform galvanized repairs to ASTM A780/A780M.

b. If the manufacturer or the applicator approved by the manufacturer fail to perform the repairs within 48 hours of notification, emergency temporary repairs performed by others does not void the warranty.

1.7.1 Manufacturer's Finish Warranty

Provide a manufacturer's 20-year "No-Dollar-Limit" warranty for labor and materials for the roofing system. Issue the warranty directly to the Government at the date of Government acceptance, warranting that the factory color finish, under normal atmospheric conditions at the site, will not crack, peel, or delaminate; chalk in excess of a numerical rating of 8 when measured in accordance with ASTM D4214; or fade or change colors in excess of 5 NBS units as measured in accordance with ASTM D2244.

1.7.2 Continuance of Warranty

Approve and accomplish repair or replacement work that becomes necessary within the warranty period to restore the integrity of the roof system assembly and maintain the validity of the metal roof system manufacturer's warranty for the remainder of the manufacturer warranty period.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

2.1.1 Conformance and Compatibility

Provide an entire roofing and flashing system in accordance with specified and indicated requirements, including wind resistance requirements. Perform any work not specifically addressed, or any deviation from specified requirements in general accordance with recommendations of the MBMA RSDM, NRCA RoofMan, the metal panel manufacturer's published recommendations and details, and compatible with surrounding components and construction. Submit any deviation from specified or indicated requirements to the Contracting Officer for approval before installation.

2.1.2 Design Requirements

a. Steel panels shall be continuous lengths to the greatest extent practical, not less than 22 GA on the exterior and 26 GA on the interior, with a panel thickness as required to achieve R-30 and minimum width of 40 inches, up to lengths as required, with a seam height of 1 1/2 inch minimum, except where indicated or specified. Provide panels with a ribbed standing seam profile and non-embossed exterior and stucco embossed interior or similar. Ribs of adjoining sheets shall be in continuous contact from eave to ridge. Individual panels of snap together type systems shall be removable for replacement of damaged material.

b. Snap together type systems shall have a capillary break and a positive side lap locking device. Field-formed seam type systems shall be mechanically locked closed by the manufacturer's locking tool. The seam shall include a continuous factory applied sealant when required by the manufacturer to withstand the wind loads specified.

c. Roof panel anchor clips shall be concealed and designed to allow

for longitudinal thermal movement of the panels, except where specific fixed points are indicated. Provide for lateral thermal movement in panel configuration or with clips designed for lateral and longitudinal movement.

2.1.3 Performance Requirements

a. Hydrostatic-Head Resistance: No water penetration when tested according to ASTM E2140.

b. Wind-Uplift Resistance: Provide roof panel assemblies and attachmentsthat are capable of resisting the ASCE 7 "component and cladding" wind pressures indicated in diagrams on the drawings. Panel assemblies shall also comply with the requirements of the roof systems and attachments in accordance with ASTM E1592 and UL 580. Ensure that uplifting force caused by wind action governs the design for panels.

c. FMG Listing: Provide FRP roof panels and component materials that comply with the requirements in FM 4471 as part of a panel roofing system. Identify materials with FMG markings.

d. Structural Performance: Provide roof panel assemblies capable of withstanding the effects of gravity loads, including snow loads and, for low roof areas adjacent to vertical surfaces, the indicated snow drift loads, and stresses within limits and under conditions indicated, based on testing according to ASTM E1592.

e. Seismic Performance: Provide fabricated roof panel assemblies conforming to AISC 341 and the test data confirming compliance.

f. Vertical deflection of roof panels under gravity or uplift pressures shall not exceed 1/240 of the panel span.

2.1.4 Fire-Resistance

2.1.4.1 Surface-Burning Characteristics

Provide metal roof panels having insulation core material with the following surface-burning characteristics as determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with the appropriate markings of an applicable testing agency.

Flame-Spread Index: 25 or less.

Smoke-Developed Index: 450 or less.

2.1.4.2 Fire-Resistance Ratings

Where indicated, provide metal roof panels identical to those of assemblies tested for fire resistance by a qualified testing agency in accordance with ASTM E119. Identify products with the appropriate markings of the applicable testing agency.

Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency. Combustion Characteristics: ASTM E136.

## 2.2 FABRICATION

### 2.2.1 Fabrication

Fabricate and finish metal roof panels and accessories at the factory to the greatest extent possible, using the manufacturer's standard procedures and processes to fulfill the indicated performance requirements. Comply with indicated profiles, and dimensional and structural requirements conforming to AISI D100.

Provide a panel profile, including major ribs and intermediate stiffening ribs, if any, for the full length of panel.

Fabricate metal roof panel side laps with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will seal weather-tight and minimize noise from movements within the panel assembly.

Sheet Metal Accessories: Fabricate flashing and trim to comply with recommendations in SMACNA 1793 that apply to the design, dimensions, metal, and other characteristics of the item indicated.

Form exposed sheet metal accessories without excessive oil canning, buckling, and tool marks, and true to the line and levels indicated, with exposed edges folded back to form hems.

End Seams: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.

Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric sealant, compliant with SMACNA 1793.

Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on the faces of accessories exposed to view.

Fabricate cleats and attachment devices of the size and metal thickness recommended by SMACNA 1793 or by the metal roof panel manufacturer for application, but not less than the thickness of the metal being secured.

### 2.2.2 Sheet Metal Flashing and Trim

See 07 60 00 FLASHING AND SHEET METAL for requirements.

#### 2.2.2.1 Fabrication, General

Custom-fabricate sheet metal flashing and trim to comply with the recommendations in SMACNA 1793 that apply to the design, dimensions, metal, and other characteristics of the items indicated. Shop-fabricate items where practicable. Obtain field measurements for an accurate fit before shop fabrication.

#### 2.2.2.2 Roof Drainage Sheet Metal Fabrications

Fabricate covered gutters to the cross section indicated, with riveted and soldered joints, complete with end pieces, outlet tubes, and other special accessories as required. Fabricate in 96-inch long sections at a minimum. Fabricate expansion joints and accessories from the same metal

as the covered gutters, unless otherwise indicated.

2.2.3 Finishes

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.

Appearance of Finished Work: Ensure that there are no noticeable variations in finish on the same piece. Variations in the appearance of adjoining components are acceptable if they are within the range of approved samples and are assembled or installed to minimize contrast.

2.3 COMPONENTS

2.3.1 Miscellaneous Metal Framing

2.3.1.1 General

See the design drawings and as-builts for additional framing requirements. Provide framing as indicated for panel lap conditions, or as required for a secure, weather-tight, and warrantable installation.

Provide cold-formed metallic-coated steel sheet conforming to AISI D100 and ASTM A653/A653M .

2.3.1.2 Fasteners for Miscellaneous Metal Framing

Provide fasteners of a type, material, corrosion resistance, size, and sufficient length to penetrate the supporting member a minimum of 1 inch and possessing the other properties required to fasten miscellaneous metal framing members to substrates in accordance with the roof-panel manufacturer's and ASCE 7 requirements.

2.3.2 Fasteners

2.3.2.1 General

Provide fasteners of a type, material, corrosion resistance, size, and sufficient length to penetrate the supporting member a minimum of 1 inch and possessing the other properties required to fasten miscellaneous metal framing members to substrates in accordance with the roof-panel manufacturer's and ASCE 7 requirements.

2.3.2.2 Exposed Fasteners

Provide corrosion-resistant coated steel, aluminum, stainless steel, or nylon-capped, steel-compatible exposed fasteners, with the sheet panel or flashing. Provide exposed fasteners of a type and size recommended by the manufacturer to meet the performance requirements and design loads specified. Provide the manufacturer's standard fasteners for accessories. Provide an integral metal washer that matches the color of material the washer is attached to with a compressible sealing EPDM gasket approximately 3/32 inch thick.

2.3.2.3 Screws

Provide corrosion-resistant coated steel, aluminum or stainless steel screws of the type and size recommended by the manufacturer to meet the performance requirements.

2.3.2.4 Rivets

Provide closed-end rivets, made of corrosion-resistant coated steel, aluminum, or stainless steel where watertight connections are required.

2.3.2.5 Attachment Clips

Provide clips fabricated from steel hot-dipped galvanized in accordance with ASTM A653/A653M G 90 or Series 300 stainless steel. Ensure that the size, shape, thickness and capacity are as required to meet the insulation thickness and design load criteria specified.

2.3.2.6 Snow Guard/Rail System

Snow guards shall be a manufactured product made from plastic, aluminum, and/or stainless steel components, finished to match the roof color. Snow guards shall be a product from a manufacturer regularly engaged in the production of such products and approved by the roof manufacturer for use on this project. Method of attachment must be clamping or adhesive style that do not gall or penetrate any portion of the roof system. Attachment with cup point setscrews is not acceptable.

2.4 MATERIALS

2.4.1 Foam-Insulation Core Roof Panel

Provide factory-formed steel roof panel assembly fabricated from two sheets of metal with modified polyisocyanurate or polyurethane foam insulation core foamed-in-place during fabrication with joints between panels designed to form weather-tight seals. Include accessories required for weather-tight installation.

a. Closed-Cell Content: 90 percent when tested according to ASTM D6226.

b. Density: 2.0 to 2.6 lb/cu. ft. when tested according to ASTM D1622.

c. Compressive Strength: Minimum 20 psi when tested according to ASTM D1621.

d. Shear Strength: 26 psi when tested according to ASTM C273/C273M.

e. Insulated panel R or U - Value: R-value = 30.0 @ 75 degrees F minimum.

2.4.2 Finish

Ensure all panels receive a factory-applied polyvinylidene fluoride finish consisting of a baked-on top-coat and a manufacturer's recommended prime coat with to the following:

a. Metal Preparation: Prepare all metal surfaces for painting on a continuous process coil coating line by alkali cleaning, hot-water rinsing, application of chemical conversion coating, cold-water rinsing, sealing with acid rinse, and thorough drying.

b. Prime Coating: Apply a base-coat of epoxy paint, specifically formulated to interact with the top-coat, to the prepared surfaces by roll-coating the paint to a dry film thickness of 0.20 mils plus 0.05

mils. Ensure that the prime coat is oven-cured before the application of finish coat is applied.

c. Exterior Finish Coating: Apply the finish coating over the primer by roll-coating the finish coating to a dry film thickness of 0.80 plus 5 mils (3.80 plus 0.50 mils for Vinyl Plastisol) for a total dry-film thickness of 1.00 mils plus 0.10 mils (4.00 mils plus 0.10 mils for Vinyl Plastisol). Ensure that the finish coat is oven-cured.

d. Interior Finish Coating: Apply a wash-coat on the reverse side over the primer by roll-coating to a dry-film thickness of 0.30 mils plus 0.05 mils for a total-dry film thickness of 0.50 mils plus 0.10 mils. Ensure that the wash-coat is oven-cured.

e. Color: See the design drawings for color reference. Provide a custom color if required to match color referenced.

f. Coating Physical Properties: Provide coating conforming to the industry and manufacturer's standard performance criteria as listed by the following certified test reports:

(1) Chalking: ASTM D4214

(2) Coating Thickness: ASTM B659

(3) Color Change and Conformity: ASTM D2244

(4) Weatherometer: ASTM G152, ASTM G153 and ASTM D822

(5) Humidity: ASTM D2247 and ASTM D714

(7) Chemical Pollution: ASTM D1308

(8) Gloss at 60: ASTM D523

(9) Pencil Hardness: ASTM D3363

(10) Reverse Impact: ASTM D2794

(11) Flexibility: ASTM D522/D522M

(12) Abrasion: ASTM D968

(13) Flame Spread: ASTM E84

## 2.5 ACCESSORIES

### 2.5.1 General

Provide only accessories which are compatible with the metal roof panels. Sheet metal flashing, trim, metal closure strips, caps and similar metal accessories can not be less than the minimum thickness specified for the roof panels. Submit a 10 inches long sample of each type. Ensure the exposed metal accessories and finishes match the panels furnished, except as otherwise indicated. Provide molded-foam rib, ridge and other closure strips which are non-absorbent closed-cell or solid-cell synthetic rubber or pre-molded neoprene to match the configuration of the panels.

2.5.2 Rubber Closure Strips

Provide closed-cell, expanded cellular rubber conforming to ASTM D1056 and ASTM D1667; extruded or molded to the configuration of the specified roof panel and in lengths supplied by the roof-panel manufacturer.

2.5.3 Metal Closure Strips

Provide factory fabricated steel closure strips of the same gauge , color, finish and profile as the specified roof panel.

2.5.4 Joint Sealants

2.5.4.1 Sealants

Provide an approved gun-type sealant for use in hand- or air-pressure caulking guns at temperatures above 40 degrees F (or frostfree application at temperatures above 10 degrees F with minimum solid content of 85 percent of the total volume. Provide sealant that has a tough, durable, dry surface skin that permits it to remain soft and pliable underneath, providing a weather-tight joint. No migratory staining is permitted on painted or unpainted metal, stone, glass, vinyl, or wood.

Prime all joints to receive sealants with a compatible one-component or two-component primer as recommended by the roof-panel manufacturer.

a. Shop-Applied Caulking: Use an approved gun-grade, non-sagging one-component polysulfide or silicone conforming to ASTM C920, Type II, with a curing time to ensure the sealant's plasticity at the time of field erection.

b. Field Applied Caulking: Use an approved gun-grade, non-sagging one-component polysulfide or two-component polyurethane with an initial maximum Shore A durometer hardness of 25, conforming to ASTM C920, Type II. Match the color to the panel colors.

c. Tape Sealant: Use a pressure-sensitive, 100 percent solid with a release paper backing, permanently elastic, non-sagging, non-toxic and non-staining as approved by the roof-panel manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION

The Contracting Officer may request verification and certification testing of coatings and base metals of metal roofing prior to installation. The following areas may be verified:

a. Examine substrates, areas, and conditions, with the installer present, for compliance with the requirements for installation tolerances, metal roof panel supports, and other conditions affecting performance of the work.

b. Examine primary and secondary roof framing to verify that rafters, purlins, angles, channels, and other structural panel support members and anchorages have been installed within alignment tolerances required by the metal roof-panel manufacturer, and as required for the geographical area where construction has taken place.

c. Examine solid roof sheathing to verify that the sheathing joints are supported by framing or blocking and that the installation is within flatness tolerances required by themetal roof-panel manufacturer.

d. Examine roughing-in for components and systems penetrating the metal roof panels to verify actual locations of penetrations relative to seam locations of metal roof panels before metal roof panel installation.

e. Submit to the Contracting Officer a written report, endorsed by the installer, listing conditions detrimental to performance of the work.

f. Proceed with the installation only after unsatisfactory conditions have been corrected.

## 3.2 PREPARATION

Clean substrates of substances harmful to insulation, remove projections capable of interfering with insulation attachment.

Install sub-purlins, eave angles, furring, and other miscellaneous roof-panel support members and anchorage according to themetal roof-panel manufacturer's written instructions.

## 3.3 INSTALLATION

### 3.3.1 Workmanship

Ensure lines, arises, and angles are sharp and true. Free exposed surfaces from visible wave, warp, buckle, and tool marks. Fold back exposed edges neatly to form a 1/2 inch hem on the concealed side. Ensure that sheet metal that is exposed to the weather is watertight, with provisions for expansion and contraction.

Ensure surfaces that are to receive sheet metal are plumb and true, clean, even, smooth, dry, and free of defects and projections that might affect the application. Install items not shown in detail or not covered by specifications conform to the applicable requirements of SMACNA 1793. Provide sheet metal flashing in the angles formed where roof decks abut walls, curbs, ventilators, pipes, or other vertical surfaces, and wherever indicated and necessary to make the work watertight.

### 3.3.2 Roof Panels

Provide metal roof panels of full length from eave to ridge or eave to wall as indicated, unless otherwise indicated or restricted by shipping limitations. Anchor metal roof panels and other components of the work in place, with provisions for thermal and structural movement in accordance with NRCA 0429.

a. Steel Roof Panels: Use stainless-steel fasteners for exterior surfaces and galvanized steel fasteners for interior surfaces.

b. Anchor Clips: Anchor metal roof panels and other components of the work securely in place. Use the manufacturer's approved fasteners according to the manufacturer's written instructions.

c. Metal Protection: Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating conforming to SSPC PS 9.01,

by applying rubberized-asphalt underlayment to each contact surface, or with another means to separate the metals and contact surface as recommended by metal roof-panel manufacturer.

d. Joint Sealers: Install gaskets, joint fillers, and sealants where required for weatherproof performance of metal roof panel assemblies. Provide the types of gaskets, fillers, and sealants indicated; or if not indicated, provide types recommended by the metal roof panel-manufacturer.

Erect the roofing system in accordance with the approved erection drawings, the printed instructions and the safety precautions of the manufacturer.

Do not overload, abuse, or subject sheets to undue impact. Do not apply bent, chipped, or defective sheets.

Erect sheets true and plumb and in exact alignment with the horizontal and vertical edges of the building, securely anchored, and with the indicated rake, eave, and curb overhang.

Allow for thermal movement of the roofing and movement of the building structure, and provide permanent freedom from noise caused by wind pressure.

Field cutting metal roof panels by torch is not permitted.

Lay roofing sheets with corrugations in the direction of the roof slope. End laps of exterior roofing cannot be less than 8 inches; the side laps of standard exterior corrugated sheets cannot be less than 2-1/2 corrugations.

Do not permit storage, walking, wheeling, and trucking directly on applied roofing materials. Provide temporary walkways, runways, and platforms of smooth clean boards or planks as necessary to avoid damage to the installed roofing materials and to distribute weight to conform to the indicated live-load limits of roof construction.

### 3.3.3 Fasteners

Anchor metal roof panels and other components of the work in place using the manufacturer's approved fasteners according to the manufacturer's written instructions.

### 3.3.4 Flashing, Trim and Closure

#### 3.3.4.1 General Requirements

Comply with performance requirements, the manufacturer's written installation instructions, and SMACNA 1793. Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather-resistant.

Install sheet metalwork to form weather-tight construction without waves, warps, buckles, fastening stresses or distortion, and allow for expansion and contraction. Ensure sheet metal mechanics perform cutting, fitting, drilling, and other operations in connection with sheet metal work required to accommodate the work of other trades.

3.3.4.2 Metal Flashing

Install metal flashing at building corners, rakes and eaves, junctions between metal siding and roofing, valleys and changes of slope or direction in metal roofing, and building expansion joints and gutters.

Provide exposed metal flashing that is the same material, color, and finish as the specified metal roofing.

Fasten flashing at not more than 8 inches on-center for roofs, except where flashing are held in place by the same screws that secure covering sheets.

Furnish flashing in at least 8 foot lengths. Provide exposed flashing that has 1 inch locked and blind-soldered end joints, and expansion joints at intervals of not more than 16 feet.

Bed exposed flashing and flashing subject to rain penetration in the specified joint sealant.

To prevent electrolytic deterioration, isolate flashing that is in contact with dissimilar metals by means of the specified asphalt-mastic material.

Form drips to the profile indicated, with the edge folded back 1/2 inch to form a reinforced drip edge.

3.3.4.3 Closures

Install metal closure strips at the open ends of corrugated or ribbed pattern roofs, and at the intersection of wall and roof unless open ends are concealed with formed eave flashing, at the rake of the metal roof unless the open end has a formed flashing member, and in other required areas.

Install mastic closure strips at the intersection of the wall with metal roofing, a the top and bottom of metal siding, at the heads of wall openings, and in other required locations.

3.4 FIELD QUALITY CONTROL

3.4.1 Acceptance Provisions

3.4.1.1 Erection Tolerances

Erect metal roofing straight and true with plumb vertical lines correctly lapped and secured in accordance with the manufacturer's written instructions. Do not vary horizontal lines more than 1/8 inch in 40 feet.

3.4.1.2 Leakage Tests

Finished application of metal roofing is subject to inspection and test for leakage by the Contracting Officer, and architect/engineer. Conduct inspections and tests without cost to the Government.

Perform inspections and tests promptly after erection to permit correction of defects and the removal and replacement of defective materials.

#### 3.4.1.3 Repairs to Finish

Repair scratches, abrasions, and minor surface defects in the finish with the specified repair materials. Ensure repaired finished surfaces are uniform and free from variations of color and surface texture.

Immediately remove and replace repaired metal surfaces that are not acceptable to the project requirements with new material.

#### 3.4.1.4 Paint-Finish Metal Roofing

Test paint-finish metal roofing for color stability by the Contracting Officer during the manufacturer's specified guarantee period.

Remove and replace panels that have visual evidence of color changes, fading, or surface degradation, with new panels at no expense to the Government.

Replaced panels are subject to the specified tests for an additional year from the date of their installation.

### 3.4.2 Manufacturer's Inspection

Ensure the manufacturer's technical representative visits the site a minimum of three times during the installation to review material installation practices and to verify the adequacy of work in place. After each inspection, submit a report, signed by the manufacturer's technical representative, to the Contracting Officer within 3 working days. Note in the report the overall quality of work, deficiencies, and any other concerns, and recommended corrective action.

Submit three signed copies of the manufacturer's field inspection reports to the Contracting Officer within one week of substantial completion.

### 3.4.3 Repair of Finish Protection

Provide repair paint for color-finish enameled roofing that is compatible with the paint of the same formula and color as the specified finish furnished by the roofing manufacturer.

## 3.5 ADJUSTING AND CLEANING

Clean all exposed sheet metal work at completion of installation. Remove metal shavings, filings, nails, bolts, and wires from roofs. Remove grease and oil films, excess sealants, handling marks, contamination from steel wool, fittings, and drilling debris and scrub the work clean. Ensure exposed metal surfaces are free of dents, creases, waves, scratch marks, solder or weld marks, and damage to the finish coating.

Collect and place scrap/waste materials in containers. Dispose of demolished materials immediately. Do not allow demolished materials to accumulate on-site; transport demolished materials from government property and legally dispose of them.

1.2 DEFINITIONS

Fabricated Wall Panel Assembly: Metal wall and liner panels, attachment system components, miscellaneous metal framing, thermal insulation, and accessories shop fabricated or field assembled for a complete weather-tight wall system.

1.3 DESCRIPTION OF FABRICATED WALL PANEL ASSEMBLY SYSTEM

Factory color finished, metal wall panel system with concealed fastening attachment. Panel profile must be embossed, recessed weather seam lock, and striated as shown on drawings. Assembled panels shall be 24-inches wide and 3-inches thick R-21 when tested at 75 degrees. Interior finish of panel assembly to be similar to exterior face.

1.3.1 Metal Wall Panel General Performance

Comply with performance requirements, conforming to AISI S100, without failure due to defective manufacture, fabrication, installation, or other defects in construction. Wall panels and accessory components must conform to the following standards:

ASTM A1008/A1008M
ASTM A123/A123M
ASTM A424/A424M, ASTM C286, PEI 1001, PEI CG-3 for Porcelain and Ceramic Enameling
ASTM A653/A653M
ASTM A463/A463M for aluminum coated steel sheet
ASTM A606/A606M
ASTM A755/A755M for metallic coated steel sheet for exterior coil pre-painted applications.
ASTM A780/A780M for repair of damage or uncoated areas of hot-dipped galvanized coating.
ASTM A924/A924M for metallic coated steel sheet
ASTM C273/C273M
ASTM D522/D522M for applied coatings
UL Bld Mat Dir

1.3.2 Structural Performance

Maximum calculated fiber stress must not exceed the allowable value in the AISI or AA manuals; a one third overstress for wind is allowed. Midspan deflection under maximum design loads is limited to L/240. Contract drawings show the design wind loads and the extent and general assembly details of the metal siding. Contractor must provide design for members and connections not shown on the drawings. Siding panels and accessories must be the products of the same manufacturer.

Provide metal wall panel assemblies complying with the load and stress requirements in accordance with ASTM E1592. Wind Load force due to wind action governs the design for panels.

Wall systems and attachments are to resist the wind loads as determined by UL 580 and ASCE 7 in the geographic area where the construction will take

place, in pounds per square foot. Submit five copies of wind load tests and seismic tests to the Contracting Officer.

Provide metal wall panel assembly for seismic conditions complying with the applicable requirements of AISC 341.

1.3.3 Air Infiltration

Air leakage must conform to the limits through the wall assembly area when tested according to ASTM E283.

1.3.4 Water Penetration Under Static Pressure

No water penetration when tested according to ASTM E331.

1.3.5 Water Penetration Under Dynamic Pressure

No evidence of water leakage when tested according to AAMA 501.1.

1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are submittal shall be used in conformance with Air Barrier specifications and Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Qualification of Manufacturer; G, RO

Qualification of Installer; G, RO

SD-02 Shop Drawings

Fabrication and Installation drawings for the following items are to indicate completely dimensioned structural frame and erection layouts, openings in the wall, special framing details, and construction details at corners, building intersections and flashing, location and type of mastic and metal filler strips.

Wall Panel Assemblies; G, DO

Flashing and Accessories; G, DO

Anchorage Systems;

SD-03 Product Data

Submit Manufacturer's catalog data for the following items:

Factory Color Finish; G, DO

Sub-girts and Formed Shapes;

Closure Materials;

Insulation; G, DO

Sealants and Caulking;

Rated Wall Assembly; G, DO

Accessories;

SD-04 Samples

Submit as required each of the following samples:

Wall Panel Assemblies, 12 inches long G, RO

Submit manufacturer's color charts and chips, approximately 4 by 4 inches, showing full range of colors, textures and patterns available for wall panels with factory applied finishes.

SD-05 Design Data

Wind Design Analysis; G, DO

SD-06 Test Reports

Submit test reports for the following in accordance with the referenced articles in this section.

Leakage Tests; G, DO

Factory Color Finish Performance Requirements

SD-07 Certificates

Submit certificates for the following items showing conformance with referenced standards contained in this section:

Qualification of Manufacturer; G, RO

Certify that the manufacturer of the metal wall panel system meets requirements specified under paragraph QUALIFICATION OF MANUFACTURER.

Qualification of Installer; G, RO

Certify that the applicator meets requirements specified under paragraph QUALIFICATION OF INSTALLATION CONTRACTOR.

SD-08 Manufacturer's Instructions

Installation of Wall Panels

Include detailed application instructions and standard manufacturer drawings altered as required by these specifications. Explicitly identify in writing, differences between manufacturer's instructions and the specified requirements.

SD-11 Closeout Submittals

Submit 20 year "No-Dollar-Limit" Warranty for labor and materials.

## 1.5 QUALITY ASSURANCE

### 1.5.1 Pre-Installation Conference

After submittals are received and approved but before wall panel work, including associated work, is performed, the Contracting Officer will hold a pre-siding conference to review the following:

a. The drawings, including Fabrication and Installation drawings,showing complete Wall Panel Assemblies, and specifications. Include details for the following for review:

    flashing and accessories
    anchorage systems
    Sub-girts and Formed Shapes
    Closure Materials, including metal closure strips.

b. Finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.

c. Methods and procedures related to metal wall panel installation, including manufacturer's written instructions for Installation of Wall panels.

d. Support conditions for compliance with requirements, including alignment between and attachment to structural members. Provide details of wind design analysis including wind speed, exposure category, co-efficient, importance factor, designates type of facility, negative pressures for each zone, methods and requirements of attachment. Wind design analysis to include wall plan delineating dimensions and attachment patterns for each zone. Wind design analysis to be prepared and sealed by Licensed Project Engineer in the geographic area where the construction will take place.

e. Flashing, special siding details, wall penetrations, openings, and condition of other construction that will affect metal wall panels.

f. Governing regulations and requirements for insurance, certificates, tests and inspections if applicable. Include certification for sustainable acquisition and wall system assembly wind load and fire rating classification. Safety plan review must include applicable Safety Data Sheets for maintenance/repair materials.

g. Temporary protection requirements for metal wall panel assembly during and after installation.

h. Wall panel observation and repair procedures after metal wall panel installation. Include review of sample Enamel Repair Paint.

i. Sample 20 year "No-Dollar-Limit" warranty.

### 1.5.2 Manufacturer's Technical Representative

The representative must have authorization from manufacturer to approve field changes and be thoroughly familiar with the products and installations in the geographical area where construction will take place.

1.5.3 Qualification of Manufacturer

Metal wall panel system manufacturer must have:

a. A minimum of five (5) years experience in manufacturing metal wall system and accessory products.

b. Provide engineering services of a structural engineer; currently licensed in the geographical area where construction will take place, and having a minimum of four (4) years experience as a structural engineer, knowledgeable in wind load design analysis, protocols and procedures for the MBMA MBSM; ASCE 7, and ASTM E1592.

c. Provide certified engineering calculations, sealed by a structural engineer having the same qualifications stated above, applicable to the products submitted for:

Wind load requirements in accordance with FM Wind Design Guide and ASCE 7.

1.5.4 Qualification of Installer

The installation contractor must be approved and certified by the wall panel manufacturer prior to beginning the installation of the metal wall system.

1.5.4.1 Qualifications for Welding Work

Welding procedures must conform to AWS A5.1/A5.1M, AWS D1.1/D1.1M for steel or AWS D1.2/D1.2M for aluminum.

1.5.5 Single Source

Obtain each type of metal wall and liner panels, clips, closures and other accessories from the standard products of the single source from a single manufacturer to operate as a complete system for the intended use.

1.5.6 Surface-Burning Characteristics

Provide metal wall panels having insulation core material with the following surface-burning characteristics as determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

a. Flame-Spread Index: 25 or less.
b. Smoke-Developed Index: 450 or less.

1.5.7 Fire-Resistance Ratings

Where indicated, provide metal wall panels identical to those of assemblies tested for fire resistance per ASTM E119 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.
Combustion Characteristics: ASTM E136.

### 1.5.8 Fabrication

Fabricate and finish metal wall panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes and as necessary to fulfill indicated performance requirements. Comply with indicated profiles and with dimensional and structural requirements.

Provide panel profile, including major ribs and intermediate stiffening ribs, if any, for full length of panel.

Fabricate metal wall panel side laps with factory-installed captive gaskets or separator strips that provide a tight seal and prevent metal-to-metal contact, in a manner that will seal weather-tight and minimize noise from movements within panel assembly.

All metal panel system, to include flashing, trim, gutters, downspouts, and roofing system shall be from same manufacturer.

#### 1.5.8.1 Sheet Metal Accessories

Fabricate flashing and trim to comply with recommendations in SMACNA 1793 that apply to the design, dimensions, metal, and other characteristics of item indicated:

a. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.

b. End Seams: Fabricate nonmoving seams with flat-lock seams. Form seams and seal with epoxy seam sealer. Rivet joints for additional strength.

c. Sealed Joints: Form non-expansion but movable joints in metal to accommodate elastomeric sealant to comply with SMACNA standards.

d. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.

e. Fabricate cleats and attachment devices of size and metal thickness recommended by SMACNA or by metal wall panel manufacturer for application, but not less than thickness of metal being secured.

### 1.5.9 Finishes

Comply with NAAMM AMP 500 for recommendations for applying and designating finishes.

Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

### 1.5.10 Sustainable Design Certification

Product shall be third party certified in accordance with ULE Greenguard Gold, SCS Scientific Certification Systems Indoor Advantage Gold or equal. Certification shall be performed annually and shall be current.

## 1.6 DELIVERY, HANDLING, AND STORAGE

Deliver and package components, sheets, metal wall panels, and other manufactured items so as not to be damaged or deformed and protected during transportation and handling.

Unload, store, and erect metal wall panels in a manner to prevent bending, warping, twisting, and surface damage.

Stack and store metal wall panels horizontally on platforms or pallets, covered with suitable weather-tight and ventilated covering to ensure dryness, with positive slope for drainage of water. Do not store metal wall panels in contact with other materials that might cause staining, denting, or other surface damage.

Retain strippable protective covering on metal wall panel for period of metal wall panel installation.

Protect foam-plastic insulation as follows:

a. Do not expose to sunlight, except to extent necessary for period of installation and concealment.

b. Protect against ignition at all times. Do not deliver foam-plastic insulation materials to Project site before installation time.

Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

## 1.7 PROJECT CONDITIONS

Weather Limitations: Proceed with installation preparation only when existing and forecasted weather conditions permit Work to proceed without water entering into existing walling system or building.

Field Measurements: Verify locations of wall framing and opening dimensions by field measurements before metal wall panel fabrication and indicate measurements on Shop Drawings.

## 1.8 WARRANTY

Furnish manufacturer's no-dollar-limit warranty for the metal wall panel system. The warranty period is to be no less than twenty (20) years from the date of Government acceptance of the work. The warranty is to be issued directly to the Government. The warranty is to provide that if within the warranty period the metal wall panel system shows evidence of corrosion, perforation, rupture or excess weathering due to deterioration of the wall panel system resulting from defective materials and correction of the defective workmanship is to be the responsibility of the metal wall panel system manufacturer. Repairs that become necessary because of defective materials and workmanship while metal wall panel system is under warranty are to be performed within 24 hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform repairs within 24 hours of notification will constitute grounds for having emergency repairs performed by others and not void the warranty.

PART 2 PRODUCTS

2.1 PANEL MATERIALS

2.1.1 Steel Sheet

Roll-form steel wall and liner panels to the specified profile, with fy = 22 gauge and depth as indicated. Material must be plumb and true, and within the tolerances listed:

a. Galvanized Steel Sheet conforming to ASTM A653/A653M and AISI SG03-3.

b. Aluminum-Zinc Alloy-coated Steel Sheet conforming to ASTM A792/A792M and AISI SG03-3.

c. Individual panels to have continuous length to cover the entire length of any unbroken wall area with no joints or seams and formed without warping, waviness, or ripples that are not part of the panel profile and free of damage to the finish coating system.

e. Provide panels with thermal expansion and contraction consistent with the type of system specified.

f. Profile and coverage to be a minimum height and width from manufacturer's standard for the indicated wall area. Metal panel is to be 24" wide with a shadowline finish on interior and exterior face of panel. All panels shall snap together with concealed clips and fasteners

g. Embossed surface texture

2.1.2 Foam-Insulation Core Wall Panel

Provide factory-formedsteel wall panel assembly fabricated from two sheets of metal with modified polyisocyanurate or polyurethane foam insulation corefoamed-in-placeduring fabrication with joints between panels designed to form weather-tight seals. Include accessories required for weather-tight installation.

a. Closed-Cell Content: 90 percent when tested according to ASTM D6226.

b. Density: 2.0 to 2.6 lb/cu. ft. when tested according to ASTM D1622/D1622M.

c. Compressive Strength: Minimum 20 psi when tested according to ASTM D1621.

d. Shear Strength: 26 psi when tested according to ASTM C273/C273M.

e. Panel Insulation R Value: R-value = 21 minimum @ 75 degrees F

2.1.3 Finish

All panels are to receive a factory-applied Kynar 500/Hylar 5000 finish consisting of a baked-on top-coat with a manufacturer's recommended prime coat conforming to the following:

a. Metal Preparation: All metal is to have the surfaces carefully

prepared for painting on a continuous process coil coating line by alkali cleaning, hot water rinsing, application of chemical conversion coating, cold water rinsing, sealing with acid rinse, and thorough drying.

b. Prime Coating: A base coat of epoxy paint, specifically formulated to interact with the top-coat, is to be applied to the prepared surfaces by roll coating to a dry film thickness of 0.20 plus 0.05 mils. This prime coat must be oven cured prior to application of finish coat.

c. Exterior Finish Coating: Apply the finish coating over the primer by roll coating to dry film thickness of 0.80 plus 5 mils (3.80 plus 0.50 mils for Vinyl Plastisol) for a total dry film thickness of 1.00 plus 0.10 mils (4.00 plus 0.10 mils for Vinyl Plastisol). This finish coat must be oven-cured.

d. Interior Finish Coating: Apply a wash-coat on the reverse side over the primer by roll coating to a dry film thickness of 0.30 plus 0.05 mils for a total dry film thickness of 0.50 plus 0.10 mils. The wash-coat must be oven-cured.

e. Color: The exterior finish chosen from the manufacturer's standard color chart.

f. Physical Properties: Coating must conform to the industry and manufacturer's standard performance criteria as listed by the following certified test reports:

| | |
|---|---|
| Chalking: | ASTM D4214 |
| Color Change and Conformity: | ASTM D2244 |
| Weatherometer: | ASTM G152, ASTM G153 and ASTM D822 |
| Humidity: | ASTM D2247 and ASTM D714 |
| Chemical Pollution: | ASTM D1308 |
| Gloss at 60: | ASTM D523 |
| Pencil Hardness: | ASTM D3363 |
| Reverse Impact: | ASTM D2794 |
| Flexibility: | ASTM D522/D522M |
| Abrasion: | ASTM D968 |
| Flame Spread: | ASTM E84 |

## 2.2 MISCELLANEOUS METAL FRAMING

### 2.2.1 General

Cold-formed metallic-coated steel sheet conforming to ASTM A653/A653M and as specified in Division 13 Section 13 34 19 " (AM 0002) PRE-ENGINEERED METAL BUILDING SYSTEM FRAMING" unless otherwise indicated.

## 2.3 FASTENERS

### 2.3.1 General

Type, material, corrosion resistance, size and sufficient length to penetrate the supporting member a minimum of 1 inch with other properties required to fasten miscellaneous metal framing members to substrates in accordance with the wall panel manufacturer's and ASCE 7 wind design requirements.

### 2.3.2 Exposed Fasteners

Fasteners for wall panels to be corrosion resistant coated steel, aluminum, stainless steel, or nylon capped steel compatible with the sheet panel or flashing and of a type and size recommended by the manufacturer to meet the performance requirements and design loads. Fasteners for accessories to be the manufacturer's standard. Provide an integral metal washer matching the color of attached material with compressible sealing EPDM gasket approximately 3/32 inches thick.

### 2.3.3 Screws

Screws to be corrosion resistant coated steel, aluminum and/or stainless steel being the type and size recommended by the manufacturer to meet the performance requirements.

### 2.3.4 Rivets

Rivets to be closed-end type, corrosion resistant coated steel, aluminum or stainless steel where watertight connections are required.

### 2.3.5 Attachment Clips

Fabricate clips from steel hot-dipped galvanized in accordance with ASTM A653/A653M, or Series 300 stainless steel. Size, shape, thickness and capacity as required meeting the insulation thickness and design load criteria specified.

## 2.4 ACCESSORIES

### 2.4.1 General

All accessories to be compatible with the metal wall panels. Sheet metal flashing, trim, metal closure strips, caps and similar metal accessories must not be less than the minimum thickness specified for the wall panels. Exposed metal accessories/finishes to match the panels furnished, except as otherwise indicated. Molded foam rib, ridge and other closure strips to be non-absorbent closed-cell or solid-cell synthetic rubber or pre-molded neoprene to match configuration of the panels.

2.4.2 Rubber Closure Strips

Closed-cell, expanded cellular rubber conforming to ASTM D1056 and ASTM D1667; extruded or molded to the configuration of the specified wall panel and in lengths supplied by the wall panel manufacturer.

2.4.3 Metal Closure Strips

Factory fabricated steel closure strips to be the same gauge, color, finish and profile of the specified wall panel.

2.4.4 Joint Sealants

2.4.4.1 Sealants and Caulking

Sealants are to be an approved gun type for use in hand- or air-pressure caulking guns at temperatures above 40 degrees F (or frost-free application at temperatures above 10 degrees F) with minimum solid content of 85 percent of the total volume. Sealant is to dry with a tough, durable surface skin which permits it to remain soft and pliable underneath, providing a weather-tight joint. No migratory staining is permitted on painted or unpainted metal, stone, glass, vinyl, or wood.

Prime all joints to receive sealants with a compatible one-component or two-component primer as recommended by the wall panel manufacturer.

2.4.4.2 Shop-Applied

Sealant for shop-applied caulking must be an approved gun grade, non-sag one component polysulfide or silicone conforming to ASTM C920, Type II, and with a curing time to ensure the sealant's plasticity at the time of field erection.

2.4.4.3 Field-Applied

Sealant for field-applied caulking must be an approved gun grade, non-sag one component polysulfide or two-component polyurethane with an initial maximum Shore A durometer hardness of 25, and conforming to ASTM C920, Type II. Color to match panel colors.

2.4.4.4 Tape Sealant

Pressure sensitive, 100 percent solid with a release paper backing; permanently elastic, non-sagging, non-toxic and non-staining as approved by the wall panel manufacturer.

2.5 SHEET METAL FLASHING AND TRIM

2.5.1 Fabrication

Shop fabricate sheet metal flashing and trim where practicable to comply with recommendations in SMACNA 1793 that apply to design, dimensions, metal, and other characteristics of item indicated. Obtain field measurements for accurate fit before shop fabrication.

Fabricate sheet metal flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.

2.6 REPAIR OF FINISH PROTECTION

Repair paint for color finish enameled wall panel must be compatible paint of the same formula and color as the specified finish furnished by the wall panel manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of the Work.

B. Examine primary and secondary wall framing to verify that rafters, purlins, angles, channels, and other structural panel support members and anchorages have been installed within alignment tolerances required by metal wall panel manufacturer, UL, ASTM, ASCE 7 and as required for the geographical area where construction will take place.

C. Examine solid wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal wall panel manufacturer.

D. Examine roughing-in for components and systems penetrating metal wall panels to verify actual locations of penetrations relative to seam locations of metal wall panels before metal wall panel installation.

E. Submit to the Contracting Officer a written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Clean substrates of substances harmful to insulation, including removing projections capable of interfering with insulation attachment.

B. Miscellaneous Framing: Install sub-purlins, girts, angles, furring, and other miscellaneous wall panel support members and anchorage according to metal wall panel manufacturer's written instructions.

3.3 WALL PANEL INSTALLATION

Provide metal wall panels of full length from sill to eave as indicated, unless otherwise indicated or restricted by shipping limitations. Anchor metal wall panels and other components of the Work securely in place, with provisions for thermal and structural movement in accordance with MBMA Metal Building Systems Manual.

a. Steel Wall Panels: Use stainless-steel fasteners for exterior surfaces and galvanized steel fasteners for interior surfaces.

c. Anchor Clips: Anchor metal wall panels and other components of the Work securely in place, using manufacturer's approved fasteners according to manufacturer's written instructions.

d. Metal Protection: Where dissimilar metals will contact each other or

corrosive substrates, protect against galvanic action by painting contact surfaces with bituminous coating, by applying rubberized-asphalt underlayment to each contact surface, or by other permanent separation as recommended by metal wall panel manufacturer.

e. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weatherproof performance of metal wall panel assemblies. Provide types of gaskets, fillers, and sealants indicated or, if not indicated, types recommended by metal wall panel manufacturer.

Erect wall panel system in accordance with the approved erection drawings, the printed instructions and safety precautions of the manufacturer.

Sheets are not to be subjected to overloading, abuse, or undue impact. Bent, chipped, or defective sheets shall not be applied.

Sheets must be erected true and plumb and in exact alignment with the horizontal and vertical edges of the building, securely anchored, and with the indicated eave, and sill.

Work is to allow for thermal movement of the wall panel, movement of the building structure, and to provide permanent freedom from noise due to wind pressure.

Field cutting metal wall panels by torch is not permitted.

## 3.4 FASTENER INSTALLATION

Anchor metal wall panels and other components of the Work securely in place, using manufacturer's approved fasteners according to manufacturer's written instructions.

## 3.5 FLASHING, TRIM AND CLOSURE INSTALLATION

### 3.5.1 General Requirements

Comply with performance requirements, manufacturer's written installation instructions, and SMACNA 1793. Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

Sheet metalwork is to be accomplished to form weather-tight construction without waves, warps, buckles, fastening stresses or distortion, and allow for expansion and contraction. Cutting, fitting, drilling, and other operations in connection with sheet metal required to accommodate the work of other trades is to be performed by sheet metal mechanics.

### 3.5.2 Metal Flashing

Exposed metal flashing is to be installed at building corners, sills and eaves, junctions between metal siding and walling.

Exposed metal flashing is to be the same material, color, and finish as the specified metal wall panel.

Flashing is to be fastened at not more than 8 inches on center, except where flashing are held in place by the same screws that secure covering

sheets.

Flashing is to be furnished in at least 8 foot lengths. Exposed flashing is to have 1 inch locked and blind-soldered end joints, and expansion joints at intervals of not more than 16 feet.

Exposed flashing and flashing subject to rain penetration to be bedded in the specified joint sealant.

Flashing which is in contact with dissimilar metals to be isolated by means of the specified asphalt mastic material to prevent electrolytic deterioration.

Drips to be formed to the profile indicated, with the edge folded back 1/2 inch to form a reinforced drip edge.

### 3.5.3 Closures

Install metal closure strips at open ends of corrugated or ribbed pattern walls, and at intersection of wall and wall unless open ends are concealed with formed eave flashing; and in other required areas.

Install mastic closure strips at intersection of the wall with metal walling; top and bottom of metal siding; heads of wall openings; and in other required locations.

## 3.6 WORKMANSHIP

Make lines, arises, and angles sharp and true. Free exposed surfaces from visible wave, warp, buckle, and tool marks. Fold back exposed edges neatly to form a 1/2 inch hem on the concealed side. Make sheet metal exposed to the weather watertight with provisions for expansion and contraction.

Make surfaces to receive sheet metal plumb and true, clean, even, smooth, dry, and free of defects and projections which might affect the application. For installation of items not shown in detail or not covered by specifications conform to the applicable requirements of SMACNA 1793. Provide sheet metal flashing in the angles formed where roof decks abut walls, curbs, ventilators, pipes, or other vertical surfaces and wherever indicated and necessary to make the work watertight.

## 3.7 ACCEPTANCE PROVISIONS

### 3.7.1 Erection Tolerances

Erect metal wall panels straight and true with plumb vertical lines correctly lapped and secured in accordance with the manufacturer's written instructions. Horizontal lines must not vary more than 1/8 inch in 40 feet.

### 3.7.2 Leakage Tests

Inspect and test finished application of metal wall panels when directed to do so by the Contracting Officer. Inspection and tests must be conducted without cost to the Government.

Inspection and testing is to be made promptly after erection to permit correction of defects and the removal and replacement of defective materials.

### 3.7.3 Repairs to Finish

Scratches, abrasions, and minor surface defects of finish may be repaired with the specified repair materials. Finished repaired surfaces must be uniform and free from variations of color and surface texture.

Repaired metal surfaces that are not acceptable to the project requirements are to be immediately removed and replaced with new material.

### 3.7.4 Paint-Finish Metal Siding

Paint-finish metal siding will be tested for color stability by the Contracting Officer during the manufacturer's specified guarantee period.

Panels that indicate color changes, fading, or surface degradation, determined by visual examination, must be removed and replaced with new panels at no expense to the Government.

New panels will be subject to the specified tests for an additional year from the date of their installation.

## 3.8 CLEAN-UP AND DISPOSAL

Clean all exposed sheet metal work at completion of installation. Remove metal shavings, filings, nails, bolts, and wires from work area. Remove grease and oil films, excess sealants, handling marks, contamination from steel wool, fittings and drilling debris and scrub the work clean. Exposed metal surfaces to be free of dents, creases, waves, scratch marks, solder or weld marks, and damage to the finish coating.

Collect and place scrap/waste materials in containers. Promptly dispose of demolished materials. Do not allow demolished materials to accumulate on-site; transport demolished materials from government property and legally dispose of them.

FLASHING AND SHEET METAL
**08/08**

PART 1 GENERAL

1.1 ROOFING SYSTEM

Flashing and sheet metal related to the building roof system are required to be included in the total roof system warranty. See 07 41 63 FABRICATED ROOF PANEL ASSEMBLIES for requirements.

1.2 REFERENCES

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

## 1.3 GENERAL REQUIREMENTS

Finished sheet metalwork will form a weathertight construction without waves, warps, buckles, fastening stresses or distortion, which allows for expansion and contraction. Sheet metal mechanic is responsible for cutting, fitting, drilling, and other operations in connection with sheet metal required to accommodate the work of other trades. Coordinate installation of sheet metal items used in conjunction with roofing with roofing work to permit continuous roofing operations.

## 1.4 SUSTAINABILITY REQUIREMENTS

Materials in this technical specification may contribute towards contract compliance with sustainability requirements. See Section 01 33 29 SUSTAINABILITY REPORTING for project requirements.

## 1.5 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Exposed Sheet Metal Coverings; G, DO

Gutters; G, DO

Downspouts; G, DO

Base flashing; G, DO

Counterflashing; G, DO

Flashing at roof penetrations; G, DO

Drip edge; G, DO

Metal Soffit Panels; G, DO

Indicate thicknesses, dimensions, fastenings and anchoring methods, expansion joints, and other provisions necessary for thermal expansion and contraction. Scaled manufacturer's catalog data may be submitted for factory fabricated items.

SD-04 Samples

Finish Samples; G, DO

SD-11 Closeout Submittals

Quality Control Plan

Submit for sheet metal work in accordance with paragraph entitled "Field Quality Control."

## 1.6 MISCELLANEOUS REQUIREMENTS

### 1.6.1 Product Data

Indicate thicknesses, dimensions, fastenings, anchoring methods, expansion joints, and other provisions necessary for thermal expansion and contraction. Scaled manufacturer's catalog data may be submitted for factory fabricated items.

### 1.6.2 Finish Samples

Submit two color charts and two finish sample chips from manufacturer's standard color and finish options for each type of finish indicated.

## 1.7 DELIVERY, HANDLING, AND STORAGE

Package and protect materials during shipment. Uncrate and inspect materials for damage, dampness, and wet-storage stains upon delivery to the job site. Remove from the site and replace damaged materials that cannot be restored to like-new condition. Handle sheet metal items to avoid damage to surfaces, edges, and ends. Store materials in dry, weather-tight, ventilated areas until immediately before installation.

# PART 2 PRODUCTS

## 2.1 MATERIALS

Do not use lead, lead-coated metal, or galvanized steel. Use any metal listed by SMACNA 1793 for a particular item, unless otherwise specified or indicated. Conform to the requirements specified and to the thicknesses and configurations established in SMACNA 1793 for the materials and application. Different items need not be of the same metal, except that if contact between dissimilar metals must be avoided..

Furnish sheet metal items in 8 to 10 foot lengths. Single pieces less than 8 feet long may be used to connect to factory-fabricated inside and outside corners, and at ends of runs. Factory fabricate corner pieces with minimum 12 inch legs. Provide accessories and other items essential to complete the sheet metal installation. Provide accessories made of the same or compatible materials as the items to which they are applied. Fabricate sheet metal items of the materials specified below and to the gage, thickness, or weight shown in Table I at the end of this section. Provide sheet metal items with mill finish unless specified otherwise. Where more than one material is listed for a particular item in Table I, each is acceptable and may be used except as follows:

### 2.1.1 Exposed Sheet Metal Items

Must be of the same material. Consider the following as exposed sheet metal: gutters, including hangers; downspouts; gravel stops and fascias; cap, valley, steeped, base, and eave copings and flashings exposed to view from exterior of building and related accessories.

### 2.1.2 Drainage

Do not use copper for an exposed item if drainage from that item will pass over exposed masonry, stonework or other metal surfaces. In addition to the metals listed in Table I, lead-coated copper may be used for such items.

2.1.3 Steel Sheet, Zinc-Coated (Galvanized)

ASTM A653/A653M.

2.1.3.1 Finish

Exposed exterior items of zinc-coated steel sheet must have a baked-on, factory-applied color coating of polyvinylidene fluoride or other equivalent fluorocarbon coating applied after metal substrates have been cleaned and pretreated. Provide finish coating dry-film thickness of 0.8 to 1.3 mils and color to match similar existing construction.

2.1.4 Zinc Sheet and Strip

ASTM B69, Type I, a minimum of 0.024 inch thick.

2.1.5 Aluminum Alloy Sheet and Plate

ASTM B209.

2.1.5.1 Alclad

When fabricated of aluminum, fabricate the items Alclad 3003, Alclad 3004, Alclad 3005, clad on one side unless otherwise indicated.

a. Gutters, downspouts, and hangers

b. Gravel stops and fascias

c. Flashing

2.1.5.2 Finish

Exposed exterior sheet metal items of aluminum must have a baked-on, factory-applied color coating of polyvinylidene fluoride (PVF2) or other equivalent fluorocarbon coating applied after metal substrates have been cleaned and pretreated. Provide finish coating dry-film thickness of 0.8 to 1.3 mils and color to match similar existing construction.

2.1.6 Aluminum Alloy, Extruded Bars, Rods, Shapes, and Tubes

ASTM B221.

2.1.7 Metal Soffit Panels

Prefinished metal soffit panel system shall be constructed of 0.04 aluminum or 22 gauge steel panels. Panels shall be a standard product from a manufacturer regularly engaged in the production of metal soffit panels. Panels shall have "flush" flat pan panel seam surface with panel joints at 7" to 12-inches O.C. Panels shall be 1/2" thick in profile with all fasteners concealed. Panel finish and color shall match adjacent rainscreen panels. Panel system shall have tension level feature to ensure flatness. Panels shall be provided with concealed fasteners, J panel cap type end, inside/outside, and soffit base/angle trim moldings.

2.1.8 Bituminous Plastic Cement

ASTM D4586/D4586M, Type I.

2.1.9 Roofing Felt

ASTM D226/D226M Type I.

2.1.10 Asphalt Primer

ASTM D41/D41M.

2.1.11 Fasteners

Use the same metal or a metal compatible with the item fastened. Use stainless steel fasteners to fasten dissimilar materials.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Workmanship

Make lines and angles sharp and true. Free exposed surfaces from visible wave, warp, buckle, and tool marks. Fold back exposed edges neatly to form a 1/2 inch hem on the concealed side. Make sheet metal exposed to the weather watertight with provisions for expansion and contraction.

Make surfaces to receive sheet metal plumb and true, clean, even, smooth, dry, and free of defects and projections. For installation of items not shown in detail or not covered by specifications conform to the applicable requirements of SMACNA 1793, Architectural Sheet Metal Manual. Provide sheet metal flashing in the angles formed where roof decks abut walls, curbs, ventilators, pipes, or other vertical surfaces and wherever indicated and necessary to make the work watertight. Join sheet metal items together as shown in Table II.

3.1.2 Nailing

Confine nailing of sheet metal generally to sheet metal having a maximum width of 18 inch. Confine nailing of flashing to one edge only. Space nails evenly not over 3 inch on center and approximately 1/2 inch from edge unless otherwise specified or indicated. Face nailing will not be permitted. Where sheet metal is applied to other than wood surfaces, include in shop drawings, the locations for sleepers and nailing strips required to secure the work.

3.1.3 Cleats

Provide cleats for sheet metal 18 inch and over in width. Space cleats evenly not over 12 inch on center unless otherwise specified or indicated. Unless otherwise specified, provide cleats of 2 inch wide by 3 inch long and of the same material and thickness as the sheet metal being installed. Secure one end of the cleat with two nails and the cleat folded back over the nailheads. Lock the other end into the seam.

3.1.4 Bolts, Rivets, and Screws

Install bolts, rivets, and screws where indicated or required. Provide compatible washers where required to protect surface of sheet metal and to provide a watertight connection. Provide mechanically formed joints in aluminum sheets 0.040 inch or less in thickness.

3.1.5 Seams

Straight and uniform in width and height with no solder showing on the face.

3.1.5.1 Flat-lock Seams

Finish not less than 3/4 inch wide.

3.1.5.2 Lap Seams

Finish soldered seams not less than one inch wide. Overlap seams not soldered, not less than 3 inch.

3.1.5.3 Loose-Lock Expansion Seams

Not less than 3 inch wide; provide minimum one inch movement within the joint. Completely fill the joints with the specified sealant, applied at not less than 1/8 inch thick bed.

3.1.5.4 Flat Seams

Make seams in the direction of the flow.

3.1.6 Welding and Mechanical Fastening

Use welding for aluminum of thickness greater than 0.040 inch. Aluminum 0.040 inch or less in thickness must be butted and the space backed with formed flashing plate; or lock joined, mechanically fastened, and filled with sealant as recommended by the aluminum manufacturer.

3.1.6.1 Welding of Aluminum

Use welding of the inert gas, shield-arc type. For procedures, appearance and quality of welds, and the methods used in correcting welding work, conform to AWS D1.2/D1.2M.

3.1.6.2 Mechanical Fastening of Aluminum

Use No. 12, aluminum alloy, sheet metal screws or other suitable aluminum alloy or stainless steel fasteners. Drive fasteners in holes made with a No. 26 drill in securing side laps, end laps, and flashings. Space fasteners 12 inch maximum on center. Where end lap fasteners are required to improve closure, locate the end lap fasteners not more than 2 inch from the end of the overlapping sheet.

3.1.7 Protection from Contact with Dissimilar Materials

3.1.7.1 Aluminum

Do not allow aluminum surfaces in direct contact with other metals except stainless steel, zinc, or zinc coating. Where aluminum contacts another metal, paint the dissimilar metal with a primer followed by two coats of aluminum paint. Where drainage from a dissimilar metal passes over aluminum, paint the dissimilar metal with a non-lead pigmented paint.

3.1.7.2 Metal Surfaces

Paint surfaces in contact with mortar, concrete, or other masonry materials with alkali-resistant coatings such as heavy-bodied bituminous paint.

3.1.7.3 Wood or Other Absorptive Materials

Paint surfaces that may become repeatedly wet and in contact with metal with two coats of aluminum paint or a coat of heavy-bodied bituminous paint.

3.1.8 Expansion and Contraction

Provide expansion and contraction joints at not more than 32 foot intervals for aluminum and at not more than 40 foot intervals for other metals. Provide an additional joint where the distance between the last expansion joint and the end of the continuous run is more than half the required interval. Space joints evenly. Join extruded aluminum gravel stops and fascias by expansion and contraction joints spaced not more than 12 feet apart.

3.1.9 Base Flashing

Extend up vertical surfaces of the flashing not less than 8 inch and not less than 4 inch under the roof covering. Where finish wall coverings form a counterflashing, extend the vertical leg of the flashing up behind the applied wall covering not less than 6 inch. Overlap the flashing strips with the previously laid flashing not less than 3 inch. Fasten the strips at their upper edge to the deck. Horizontal flashing at vertical surfaces must extend vertically above the roof surface and fastened at their upper edge to the deck a minimum of 6 inch on center with appropriate fasteners a minimum of 2-inch lap of any surface. Solder end laps and provide for expansion and contraction. Extend the metal flashing over crickets at the up-slope side of curbs, vertical surfaces extending through sloping roofs, the metal flashings. Extend the metal flashings onto the roof covering not less than 4.5 inch at the lower side of vertical surfaces extending through the roof decks. Install and fit the flashings so as to be completely weathertight. Provide factory-fabricated base flashing for interior and exterior corners. Do not use metal base flashing on built-up roofing.

3.1.10 Counterflashing

Except where indicated or specified otherwise, insert counterflashing in reglets located from 9 to 10 inch above roof decks, extend down vertical surfaces over upturned vertical leg of base flashings not less than 3 inch. Fold the exposed edges of counterflashings 1/2 inch. Where stepped counterflashings are required, they may be installed in short lengths a minimum 8 inch by 8 inch or may be of the preformed one-piece type. Provide end laps in counterflashings not less than 3 inch and make it weathertight with plastic cement. Do not make lengths of metal counterflashings exceed 10 feet. Form the flashings to the required shapes before installation. Factory-form the corners not less than 12 inch from the angle. Secure the flashings in the reglets with lead wedges and space not more than 18 inch apart; on short runs, place wedges closer together. Fill caulked-type reglets or raked joints which receive counterflashing with caulking compound. Turn up the concealed edge of counterflashings built into masonry or concrete walls not less than 1/4

inch and extend not less than 2 inch into the walls. Install counterflashing to provide a spring action against base flashing.

3.1.11 Fascias

Prefabricate in the shapes and sizes indicated and in lengths not less that 8 feet. Extend flange at least 4 inch onto roofing. Provide prefabricated, mitered corners internal and external corners. Install gravel stops and fascias after all plies of the roofing membrane have been applied, but before the flood coat of bitumen is applied. Prime roof flange of fascias on both sides with an asphalt primer. After primer has dried, set flange on roofing membrane and strip-in.Nail flange securely to wood nailer with large-head, barbed-shank roofing nails 1.5 inch long spaced not more than 3 inch on center, in two staggered rows.

3.1.11.1 Edge Strip

Hook the lower edge of fascias at least 3/4 inch over a continuous strip of the same material bent outward at an angle not more than 45 degrees to form a drip. Nail hook strip to a wood nailer at 6 inchmaximum on center. Where fastening is made to concrete or masonry, use screws spaced 12 inch on center driven in expansion shields set in the concrete or masonry. Where horizontal wood nailers are slotted to provide for insulation venting, install strips to prevent obstruction of vent slots. Where necessary, install strips over 1/16 inch thick compatible spacer or washers.

3.1.11.2 Joints

Leave open the section ends of fascias 1/4 inch and backed with a formed flashing plate, mechanically fastened in place and lapping each section end a minimum of 4 inch set laps in plastic cement. Face nailing will not be permitted. Install prefabricated aluminum gravel stops and fascias in accordance with the manufacturer's printed instructions and details.

3.1.12 Metal Drip Edge

Provide a metal drip edge, designed to allow water run-off to drip free of underlying construction, at eaves and rakes prior to the application of roofing shingles. Apply directly on the wood deck at the eaves and over the underlay along the rakes. Extend back from the edge of the deck not more than 3 inch and secure with compatible nails spaced not more than 10 inch on center along upper edge.

3.1.13 Gutters

The hung type of shape indicated and supported on underside by brackets that permit free thermal movement of the gutter. Provide gutters in sizes indicated complete with mitered corners, end caps, outlets, brackets, and other accessories necessary for installation. Bead with hemmed edge or reinforce the outer edge of gutter with a stiffening bar not less than 3/4 by 3/16 inch of material compatible with gutter. Fabricate gutters in sections not less than 8 feet. Lap the sections a minimum of one inch in the direction of flow or provide with concealed splice plate 6 inch minimum. Join the gutters, other than aluminum, by riveted and soldered joints. Join aluminum gutters with riveted sealed joints. Provide expansion-type slip joints midway between outlets. Install gutters below slope line of the roof so that snow and ice can slide clear. Space gutters supports not more than 30 inch on center or by cleats spaced not

less than 36 inch apart. Adjust gutters to slope uniformly to outlets, with high points occurring midway between outlets. Fabricate hangers and fastenings from metals.

3.1.14 Downspouts

Space supports for downspouts according to the manufacturer's recommendation for the substrate. Types, shapes and sizes are indicated. Provide complete including elbows and offsets. Provide downspouts in approximately 10 foot lengths. Provide end joints to telescope not less than 1/2 inch and lock longitudinal joints. Provide gutter outlets with wire ball strainers for each outlet. Provide strainers to fit tightly into outlets and be of the same material used for gutters. Keep downspouts not less than one inch away from walls. Fasten to the walls at top, bottom, and at intermediate point(s) not to exceed 5 feet on center with leader straps or concealed rack-and-pin type fasteners. Form straps and fasteners of metal compatible with the downspouts.

3.1.14.1 Terminations

Neatly fit into the drainage connection the downspouts terminating in drainage lines and fill the joints with a portland cement mortar cap sloped away from the downspout. Provide downspouts terminating in splash blocks with elbow-type fittings. Provide splash pans as specified.

3.1.15 Copings

Install per roof manufacturer's requirements for water-tightness, wind-uplift, and warranty for roof system.

3.1.16 Expansion Joints

Provide expansion joints for roofs, walls, and floors as indicated. Assure expansion joints are continuous and accommodate prescribed movement continuously along the length of the joint. Conform to the requirements of Table I.

3.1.16.1 Floor and Wall Expansion Joints

Provide types and configurations indicated in design documents. See 05 50 13 MISCELLANEOUS METAL FABRICATIONS for additional requirements.

3.1.17 Sheet Metal Covering on Flat, Sloped, or Curved Surfaces

Except as specified or indicated otherwise, cover and flash all minor flat, sloped, or curved surfaces such as crickets, bulkheads, dormers and small decks with metal sheets of the material used for flashing; maximum size of sheets, 16 by 18 inch. Fasten sheets to sheathing with metal cleats. Lock seams and solder. Lock aluminum seams as recommended by aluminum manufacturer. Provide an underlayment of roofing felt for all sheet metal covering.

3.1.18 Flashing at Roof Penetrations and Equipment Supports

Provide metal flashing for all pipes, ducts, and conduits projecting through the roof surface and for equipment supports, guy wire anchors, and similar items supported by or attached to the roof deck.

### 3.1.19 Single Pipe Vents

See Table I, footnote (d). Set flange of sleeve in bituminous plastic cement and nail 3 inch on center. Bend the top of sleeve over and extend down into the vent pipe a minimum of 2 inch. For long runs or long rises above the deck, where it is impractical to cover the vent pipe with lead, use a two-piece formed metal housing. Set metal housing with a metal sleeve having a 4 inch roof flange in bituminous plastic cement and nailed 3 inch on center. Extend sleeve a minimum of8 inch above the roof deck and lapped a minimum of 3 inch by a metal hood secured to the vent pipe by a draw band. Seal the area of hood in contact with vent pipe with an approved sealant.

### 3.1.20 Stepped Flashing

Stepped flashing shall be installed where sloping roofs surfaced with shingles abut vertical surfaces. Separate pieces of base flashing shall be placed in alternate shingle courses.

### 3.1.21 Metal Soffit Panels

Install per manufacturer installation instructions and as indicated in the design drawings. Panels shall be provided with concealed fasteners, J panel cap type end, inside/outside, and soffit base/angle trim moldings.

### 3.1.22 Concrete Splash Blocks

Provide where indicated in the design drawings. Set and shim in a manner that will provide positive drainage away from building.

## 3.2 PAINTING

Touch ups in the field may be applied only after metal substrates have been cleaned and pretreated in accordance with manufacturer's written instructions and products.

Field-paint sheet metal for separation of dissimilar materials.

### 3.2.1 Aluminum Surfaces

Shall be solvent cleaned and given one coat of zinc-molybdate primer and one coat of aluminum paint.

## 3.3 CLEANING

Clean exposed sheet metal work at completion of installation. Remove grease and oil films, handling marks, contamination from steel wool, fittings and drilling debris, and scrub-clean. Free the exposed metal surfaces of dents, creases, waves, scratch marks, and solder or weld marks.

## 3.4 REPAIRS TO FINISH

Scratches, abrasions, and minor surface defects of finish may be repaired in accordance with the manufacturer's printed instructions and as approved. Repair damaged surfaces caused by scratches, blemishes, and variations of color and surface texture. Replace items which cannot be repaired.

## 3.5 FIELD QUALITY CONTROL

Establish and maintain a Quality Control Plan for sheet metal used in conjunction with roofing to assure compliance of the installed sheet metalwork with the contract requirements. Remove work that is not in compliance with the contract and replace or correct. Include quality control, but not be limited to, the following:

a. Observation of environmental conditions; number and skill level of sheet metal workers; condition of substrate.

b. Verification that specified material is provided and installed.

c. Inspection of sheet metalwork, for proper size(s) and thickness(es), fastening and joining, and proper installation.

### 3.5.1 Procedure

Submit for approval prior to start of roofing work. Include a checklist of points to be observed. Document the actual quality control observations and inspections. Furnish a copy of the documentation to the Contracting Officer at the end of each day.

TABLE I. SHEET METAL WEIGHTS, THICKNESSES, AND GAGES

| Sheet Metal Items | Aluminum, inch | Zinc-Coated Steel, U.S. Std. Gage |
|---|---|---|
| Covering on minor flat, pitched or curved surfaces | .040 | - |
| Downspouts and leaders | .032 | 24 |
| Downspout clips and anchors | .040 clip<br>.125 anchor | - |

FIRESTOPPING
**05/10**

PART 1 GENERAL

1.1 SUMMARY

Furnish and install tested and listed firestopping systems, combination of materials, or devices to form an effective barrier against the spread of flame, smoke and gases, and maintain the integrity of fire resistance rated walls, partitions, floors, and ceiling-floor assemblies, including through-penetrations and construction joints and gaps.

a. Through-penetrations include the annular space around pipes, tubes, conduit, wires, cables and vents.

b. Construction joints include those used to accommodate expansion, contraction, wind, or seismic movement; firestopping material shall not interfere with the required movement of the joint.

Gaps requiring firestopping include gaps between the building girt plane , the floor slab, , between the top of the fire-rated walls and the roof or floor deck above, and at the intersection of shaft assemblies and adjoining fire resistance rated assemblies.

## 1.3 SEQUENCING

Coordinate the specified work with other trades. Apply firestopping materials, at penetrations of pipes and ducts, prior to insulating, unless insulation meets requirements specified for firestopping. Apply firestopping materials. at building joints and construction gaps, prior to completion of enclosing walls or assemblies. Cast-in-place firestop devices shall be located and installed in place before concrete placement. Pipe, conduit or cable bundles shall be installed through cast-in-place device after concrete placement but before area is concealed or made inaccessible. Firestop material shall be inspected and approved prior to final completion and enclosing of any assemblies that may conceal installed firestop.

## 1.4 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Firestopping Materials; G, DO

SD-07 Certificates

Firestopping Materials
Installer Qualifications; G,DO

1.5 QUALITY ASSURANCE

1.5.1 Installer

Engage an experienced Installer who is:

a. FM Research approved in accordance with FM 4991, operating as a UL Certified Firestop Contractor, or

b. Certified, licensed, or otherwise qualified by the firestopping manufacturer as having the necessary staff, training, and a minimum of 3 years experience in the installation of manufacturer's products in accordance with specified requirements. Submit documentation of this experience. A manufacturer's willingness to sell its firestopping products to the Contractor or to an installer engaged by the Contractor does not in itself confer installer qualifications on the buyer. The Installer shall have been trained by a direct representative of the manufacturer (not distributor or agent) in the proper selection and installation procedures. The installer shall obtain from the manufacturer and submit written certification of training, and retain proof of certification for duration of firestop installation.

1.6 DELIVERY, STORAGE, AND HANDLING

Deliver materials in the original unopened packages or containers showing name of the manufacturer and the brand name. Store materials off the ground, protected from damage and exposure to elements and temperatures in accordance with manufacturer requirements. Remove damaged or deteriorated materials from the site. Use materials within their indicated shelf life.

PART 2 PRODUCTS

2.1 FIRESTOPPING SYSTEM

Submit detail drawings including manufacturer's descriptive data, typical details conforming to UL Fire Resistance or other details certified by another nationally recognized testing laboratory, installation instructions or UL listing details for a firestopping assembly in lieu of fire-test data or report. For those firestop applications for which no UL tested system is available through a manufacturer, a manufacturer's engineering judgment, derived from similar UL system designs or other tests, shall be submitted for review and approval prior to installation. Submittal must indicate the firestopping material to be provided for each type of application. When more than a total of 5 penetrations and/or construction joints are to receive firestopping, provide drawings that indicate location, "F" "T" and "L" ratings, and type of application.

Also, submit a written report indicating locations of and types of penetrations and types of firestopping used at each location; record type by UL list printed numbers.

## 2.2 FIRESTOPPING MATERIALS

Provide firestopping materials, supplied from a single domestic manufacturer, consisting of commercially manufactured, asbestos-free, nontoxic products FM APP GUIDE approved, or UL listed, for use with applicable construction and penetrating items, complying with the following minimum requirements:

### 2.2.1 Fire Hazard Classification

Material shall have a flame spread of 25 or less, and a smoke developed rating of 50 or less, when tested in accordance with ASTM E84 or UL 723. Material shall be an approved firestopping material as listed in UL Fire Resistance or by a nationally recognized testing laboratory.

### 2.2.2 Toxicity

Material shall be nontoxic and carcinogen free to humans at all stages of application or during fire conditions and shall not contain hazardous chemicals or require harmful chemicals to clean material or equipment.

### 2.2.3 Fire Resistance Rating

Firestop systems shall be UL Fire Resistance listed or FM APP GUIDE approved with "F" rating at least equal to fire-rating of fire wall or floor in which penetrated openings are to be protected. Where required, firestop systems shall also have "T" rating at least equal to the fire-rated floor in which the openings are to be protected.

#### 2.2.3.1 Through-Penetrations

Firestopping materials for through-penetrations, as described in paragraph SUMMARY, shall provide "F", "T" and "L" fire resistance ratings in accordance with ASTM E814 or UL 1479. Fire resistance ratings shall be as follows:

##### 2.2.3.1.1 Penetrations of Fire Resistance Rated Walls and Partitions

F Rating = 1- hourRating of wall or partition being penetrated.

#### 2.2.3.2 Construction Joints and Gaps

Fire resistance ratings of construction joints, as described in paragraph SUMMARY, and gaps such as those between floor slabs and curtain walls shall be the same as the construction in which they occur. Construction joints and gaps shall be provided with firestopping materials and systems that have been tested in accordance with ASTM E119, ASTM E1966 or UL 2079 to meet the required fire resistance rating. Curtain wall joints shall be provided with firestopping materials and systems that have been tested in accordance with ASTM E2307 to meet the required fire resistance rating. Systems installed at construction joints shall meet the cycling requirements of ASTM E1399/E1399M or UL 2079. All joints at the intersection of the top of a fire resistance rated wall and the underside of a fire-rated floor, floor ceiling, or roof ceiling assembly shall provide a minimum class II movement capability.

### 2.2.4 Material Certification

Submit certificates attesting that firestopping material complies with the

specified requirements. For all intumescent firestop materials used in through penetration systems, manufacturer shall provide certification of compliance with UL 1479.

## PART 3 EXECUTION

### 3.1 PREPARATION

Areas to receive firestopping must be free of dirt, grease, oil, or loose materials which may affect the fitting or fire resistance of the firestopping system. For cast-in-place firestop devices, formwork or metal deck to receive device prior to concrete placement must be sound and capable of supporting device. Prepare surfaces as recommended by the manufacturer.

### 3.2 INSTALLATION

Completely fill void spaces with firestopping material regardless of geometric configuration, subject to tolerance established by the manufacturer. Firestopping systems for filling floor voids 4 inches or more in any direction must be capable of supporting the same load as the floor is designed to support or be protected by a permanent barrier to prevent loading or traffic in the firestopped area. Install firestopping in accordance with manufacturer's written instructions. Provide tested and listed firestop systems in the following locations, except in floor slabs on grade:

a. Penetrations of duct, conduit, tubing, cable and pipe through floors and through fire-resistance rated walls, partitions, and ceiling-floor assemblies.

b. Penetrations of vertical shafts such as pipe chases, elevator shafts, and utility chutes.

c. Gaps at the intersection of floor slabs and curtain walls, including inside of hollow curtain walls at the floor slab.

d. Gaps at perimeter of fire-resistance rated walls and partitions, such as between the top of the walls and the bottom of roof decks.

e. Construction joints in floors and fire rated walls and partitions.

f. Other locations where required to maintain fire resistance rating of the construction.

#### 3.2.1 Insulated Pipes and Ducts

Thermal insulation shall be cut and removed where pipes or ducts pass through firestopping, unless insulation meets requirements specified for firestopping. Replace thermal insulation with a material having equal thermal insulating and firestopping characteristics.

#### 3.2.2 Fire Dampers

Install and firestop fire dampers in accordance with Section 23 00 00 AIR SUPPLY, DISTRIBUTION, VENTILATION, AND EXHAUST SYSTEM. Firestop installed with fire damper must be tested and approved for use in fire damper system. Firestop installed with fire damper must be tested and approved for use in fire damper system.

### 3.2.3 Data and Communication Cabling

Cabling for data and communication applications shall be sealed with re-enterable firestopping products or devices.

#### 3.2.3.1 Re-Enterable Devices

Firestopping devices shall be pre-manufactured modular devices, containing built-in self-sealing intumescent inserts. Firestopping devices shall allow for cable moves, additions or changes without the need to remove or replace any firestop materials. Devices must be capable of maintaining the fire resistance rating of the penetrated membrane at 0 percent to 100 percent visual fill of penetrants; while maintaining "L" rating of <10 cfm/sf measured at ambient temperature and 400 degrees F at 0 percent to 100 percent visual fill.

#### 3.2.3.2 Re-Sealable Products

Provide firestopping pre-manufactured modular products, containing self-sealing intumescent inserts. Firestopping products shall allow for cable moves, additions or changes. Devices shall be capable of maintaining the fire resistance rating of the penetrated membrane at 0 percent to 100 percent visual fill of penetrants.

## 3.3 INSPECTION

For all projects, the firestopped areas shall not be covered or enclosed until inspection is complete and approved by the Contracting Officer. Inspect the applications initially to ensure adequate preparations (clean surfaces suitable for application, etc.) and periodically during the work to assure that the completed work has been accomplished according to the manufacturer's written instructions and the specified requirements. Submit written reports indicating locations of and types of penetrations and types of firestopping used at each location; type shall be recorded by UL listed printed numbers.

### 3.3.1 Inspection Standards

Inspect all firestopping in accordance with ASTM E2393 and ASTM E2174 for firestop inspection, and document inspection results to be submitted.

### 3.3.2 Inspection Reports

Submit inspection report stating that firestopping work has been inspected and found to be applied according to the manufacturer's recommendations and the specified requirements.

1.2 SUBMITTALS

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

Sealants; G, RO

Primers; G, RO

Bond Breakers; G, RO

Backstops; G, RO

SD-06 Test Reports

Field Adhesion; G, RO

SD-07 Certificates

Indoor Air Quality For Interior Sealants

1.3 PRODUCT DATA

Include storage requirements, shelf life, curing time, instructions for mixing and application, and accessories. Provide manufacturer's Safety Data Sheets (SDS) for each solvent, primer and sealant material proposed.

1.4 CERTIFICATIONS

1.4.1 Indoor Air Quality Certifications

Submit required indoor air quality certifications in one submittal package.

1.4.1.1 Adhesives and Sealants

Provide products certified to meet indoor air quality requirements by UL 2818 (Greenguard) Gold, SCS Global Services Indoor Advantage Gold or

provide certification or validation by other third-party program that products meet the requirements of this Section. Provide current product certification documentation from certification body. When product does not have certification, provide validation that product meets the indoor air quality product requirements cited herein.

1.5 ENVIRONMENTAL CONDITIONS

Apply sealant when the ambient temperature is between 40 and 90 degrees F.

1.6 DELIVERY AND STORAGE

Deliver materials to the jobsite in unopened manufacturers' sealed shipping containers, with brand name, date of manufacture, color, and material designation clearly marked thereon. Label elastomeric sealant containers to identify type, class, grade, and use. Handle and store materials in accordance with manufacturer's printed instructions. Prevent exposure to foreign materials or subjection to sustained temperatures exceeding 90 degrees F or lower than 0 degrees F. Keep materials and containers closed and separated from absorptive materials such as wood and insulation.

1.7 QUALITY ASSURANCE

1.7.1 Compatibility with Substrate

Verify that each sealant is compatible for use with each joint substrate in accordance with sealant manufacturer's printed recommendations for each application.

1.7.2 Joint Tolerance

Provide joint tolerances in accordance with manufacturer's printed instructions.

1.7.3 Adhesion

Provide in accordance with ASTM C1193 or ASTM C1521.

PART 2 PRODUCTS

2.1 SEALANTS

Provide sealant products that have been tested, found suitable, and documented as such by the manufacturer for the particular substrates to which they will be applied.

In areas with ambient temperatures that exceed 110 degrees F, do not use polybutene, bituminous, acrylic-latex, polyvinyl acetate latex sealants, polychloroprene (neoprene), polyvinyl chloride (PVC), and polyurethane foams, and neoprene, PVC, and styrene butadiene rubber extruded seals and closure strips due to these materials having maximum recommended surface temperature ranges from 130 to 180 degrees F.

2.1.1 Interior Sealants

Provide ASTM C834. Provide sealant products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for

either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide certification or validation of indoor air quality for interior sealants. Location(s) and color(s) of sealant for the following. Note, color "as selected" refers to manufacturer's full range of color options

| LOCATION | COLOR |
|---|---|
| a. Small voids between walls or partitions and adjacent lockers, casework, shelving, door frames, built-in or surface mounted equipment and fixtures, and similar items. | As selected |
| b. Perimeter of frames at doors, windows, and access panels which adjoin exposed interior concrete and masonry surfaces. | Match adjacent construction |
| c. Joints of interior masonry walls and partitions which adjoin columns, pilasters, concrete walls, and exterior walls unless otherwise detailed. | Match adjacent construction |
| d. Joints between edge members for acoustical tile and adjoining vertical surfaces. | Match adjacent construction |
| e. Interior locations, not otherwise indicated or specified, where small voids exist between materials specified to be painted. | Match adjacent construction |
| f. joints between shower receptors and tile; joints formed where non-planar tile surfaces meet. | Match grout color or adjacent construction |
| g. Joints formed between tile floors and tile base cove; joints between tile and dissimilar materials; joints occurring where substrates change. | Match grout color or adjacent construction |
| h. Behind escutcheon plates at valve pipe penetrations and showerheads in showers. | As selected |

2.1.2 Exterior Sealants

For joints in vertical surfaces, provide ASTM C920, Type S or M, Grade NS, Class 25, Use NT. For joints in horizontal surfaces, provide ASTM C920, Type S or M, Grade P, Class 25, Use T. Provide location(s) and color(s) of sealant as follows. Note, color "as selected" refers to manufacturer's full range of color options:

| LOCATION | COLOR |
|---|---|
| a. Joints and recesses formed where frames and subsills of windows, doors, louvers, and vents adjoin masonry, concrete, or metal frames. Use sealant at both exterior and interior surfaces of exterior wall penetrations. | Match adjacent surface color |
| b. Joints between exterior masonry walls. | Match adjacent surface color |
| c. Masonry joints where shelf angles occur. | Match adjacent surface color |
| e. Expansion and control joints. | Match adjacent surface color |
| f. Interior face of expansion joints in exterior concrete or masonry walls where metal expansion joint covers are not required. | Match adjacent surface color |
| g. Voids where items pass through exterior walls. | Match adjacent surface color |
| h. Metal reglets, where flashing is inserted into masonry joints, and where flashing is penetrated by coping dowels. | Match adjacent surface color |
| i. Metal-to-metal joints where sealant is indicated or specified. | Match adjacent surface color |
| j. Joints between ends of fasciae, copings, and adjacent walls. | Match adjacent surface color |

2.1.3 Floor Joint Sealants

ASTM C920, Type S or M, Grade P, Class 25, Use T. Provide sealant products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide certification or validation of indoor air quality for interior floor joint sealants. Provide location(s) and color(s) of sealant as follows. Note, color "as selected" refers to manufacturer's full range of color options:

| LOCATION | COLOR |
|---|---|
| a. Seats of metal thresholds for exterior doors. | As selected |

| LOCATION | COLOR |
|---|---|
| b. Control and expansion joints in floors, slabs, ceramic tile, and walkways. | Match adjacent surface color |

2.1.4 Acoustical Sealants

Rubber or polymer based acoustical sealant in accordance with ASTM C919 to have a flame spread of 25 or less and a smoke developed rating of 50 or less when tested in accordance with ASTM E84. Provide non-staining acoustical sealant with a consistency of 250 to 310 when tested in accordance with ASTM D217. Acoustical sealant must remain flexible and adhesive after 500 hours of accelerated weathering as specified in ASTM C734. Provide sealant products used on the interior of the building (defined as inside of the weatherproofing system) meeting either emissions requirements of CDPH SECTION 01350 (limit requirements for either office or classroom spaces regardless of space type) or VOC content requirements of SCAQMD Rule 1168. Provide certification or validation of indoor air quality for interior acoustical sealants.

2.1.5 Preformed Sealants

Provide preformed sealants of polybutylene or isoprene-butylene based pressure sensitive weather resistant tape or bead sealants capable of sealing out moisture, air and dust when installed as recommended by the manufacturer. At temperatures from minus 30 to plus 160 degrees F, sealants must be non-bleeding and have no loss of adhesion.

2.1.5.1 Foam Strip

Provide foam strip of polyurethane foam with cross section dimensions as required for joint per manufacturer recommendation for application. Provide foam strip capable of sealing out moisture, air, and dust when installed and compressed in accordance with manufacturer's printed instructions. Service temperature must be minus 40 to plus 275 degrees F. Furnish untreated strips with adhesive to hold them in place. Do not allow adhesive to stain or bleed onto adjacent finishes. Saturate treated strips with butylene waterproofing or impregnate with asphalt.

2.2 PRIMERS

Non-staining, quick drying type and consistency as recommended by the sealant manufacturer for the particular application. Provide primers for interior applications that meet the indoor air quality requirements of the paragraph SEALANTS above.

2.3 BOND BREAKERS

Type and consistency as recommended by the sealant manufacturer to prevent adhesion of the sealant to the backing or to the bottom of the joint. Provide bond breakers for interior applications that meet the indoor air quality requirements of the paragraph SEALANTS above.

2.4 BACKSTOPS

Provide glass fiber roving, neoprene, butyl, polyurethane, or polyethylene foams free from oil or other staining elements as recommended by sealant

manufacturer. Provide 25 to 33 percent oversized backing for closed cell and 40 to 50 percent oversized backing for open cell material, unless otherwise indicated. Provide backstop material that is compatible with sealant. Do not use oakum or other types of absorptive materials as backstops.

2.4.1 Rubber

Provide in accordance with ASTM D1056, Type 2, closed cell, Class A, Grade 1, round cross section for cellular rubber sponge backing.

2.4.2 Synthetic Rubber

Provide in accordance with ASTM C509, Option Ipreformed rods or tubes for synthetic rubber backing.

2.4.3 Neoprene

Provide in accordance with ASTM D1056, closed cell expanded neoprene cord Type 2, Class C, Grade 2C2 for neoprene backing.

2.4.4 Butyl Rubber Based

Provide in accordance with ASTM C1311, from a single component, with solvent release. color to match adjacent material..

2.5 CLEANING SOLVENTS

Provide type(s) recommended by the sealant manufacturer and in accordance with environmental requirements herein. . Provide solvents for interior applications that meet the indoor air quality requirements of the paragraph SEALANTS above.

PART 3 EXECUTION

3.1 FIELD QUALITY CONTROL

Perform a field adhesion test in accordance with manufacturer's instructions and ASTM C1193, Method A or ASTM C1521, Method A, Tail Procedure. Remove sealants that fail adhesion testing; clean substrates, reapply sealants, and re-test. Test sealants adjacent to failed sealants. Submit field adhesion test report indicating tests, locations, dates, results, and remedial actions taken.

3.2 SURFACE PREPARATION

Prepare surfaces according to manufacturer's printed installation instructions. Clean surfaces from dirt, frost, moisture, grease, oil, wax, lacquer, paint, or other foreign matter that would destroy or impair adhesion. Remove oil and grease with solvent; thoroughly remove solvents prior to sealant installation. Wipe surfaces dry with clean cloths. When resealing an existing joint, remove existing caulk or sealant prior to applying new sealant. For surface types not listed below, provide in accordance with sealant manufacturer's printed instructions for each specific surface.

3.2.1 Steel Surfaces

Remove loose mill scale by sandblasting or, if sandblasting is impractical

or would damage finished work, scraping and wire brushing. Remove protective coatings by sandblasting or using a residue free solvent. Remove resulting debris and solvent residue prior to sealant installation.

3.2.2 Aluminum or Bronze Surfaces
